

National Accounts 1970-2008

This series consists mainly of primary statistics, statistics from statistical accounting systems and results of special censuses and surveys, for reference and documentation purposes. Presentation is basically in the form of tables, figures and necessary information about data, collection and processing methods, and concepts and definitions. In addition, a short overview of the main results is given. The series also includes Statistical Yearbook of Norway

Preface

This publication presents key figures from the Norwegian national accounts. Supply and use tables are presented for the years 1970–2008, and figures from the institutional sector accounts for the years 1978–2008. The 2007 and 2008 figures are preliminary.

The figures presented here are compiled according to the guidelines of the System of National Accounts 1993 and the European System of National Accounts 1995. Terms and classifications in the national accounts are defined in the text. All figures in this publication, including additional figures, can be accessed at the following website http://www.ssb.no/english/subjects/09/01/regnskap_en/

This publication is also available in Norwegian: Nasjonalregnskapsstatistikk 1970–2008.

This publication was prepared by Advisor Karin Snesrud and Senior Executive Officer Hilde Midsem, Division for National Accounts. The Head of Division is Ann Lisbet Brathaug.

1. Introduction

Figure 1. Gross domestic product per capita. Selected OECD countries. 2007. Adjusted for differences in price levels. Indices. OECD average = 100

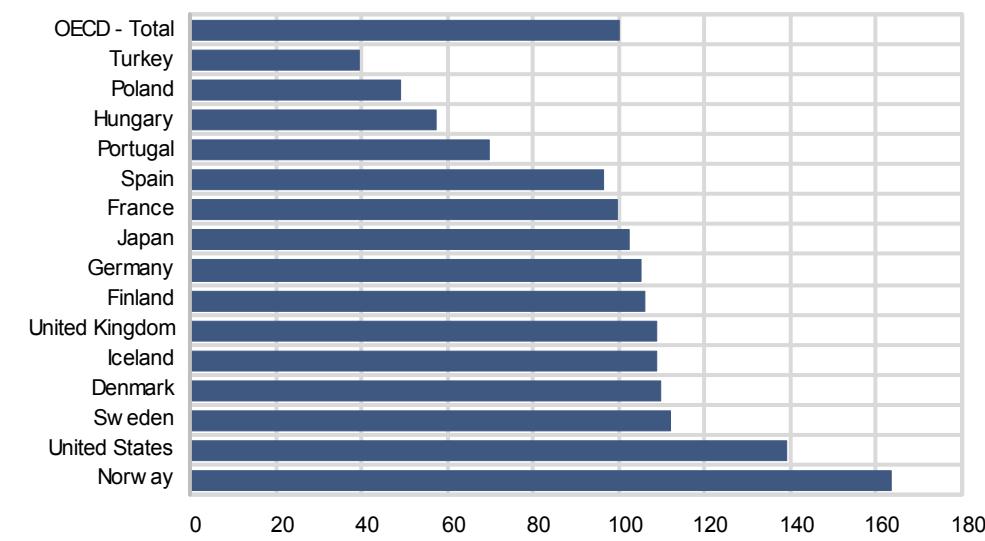

Figure 1 shows the levels of the gross domestic product (GDP) per capita for selected OECD countries in 2007, adjusted for differences in price levels. Luxembourg has the highest GDP per capita, while Norway has the second highest level, with a GDP per capita of more than 60 per cent above the OECD average. Among the OECD countries, Turkey had the lowest level of GDP per capita in 2007.

Luxembourg is in a special position in this context due to the large number of frontier workers commuting to Luxembourg from neighbouring countries. The frontier workers contribute to the GDP, but are not included in the population figures since they are not citizens of Luxembourg. The GDP per capita in Luxembourg is therefore overstated - to some extent - compared with other countries.

The oil industry is of great importance to Norway. In 2007, the oil industry accounted for approximately 25 per cent of the GDP.

Figure 2. Gross domestic product of Norway and gross domestic product of mainland Norway. 1970-2008. Annual percentage change in volume

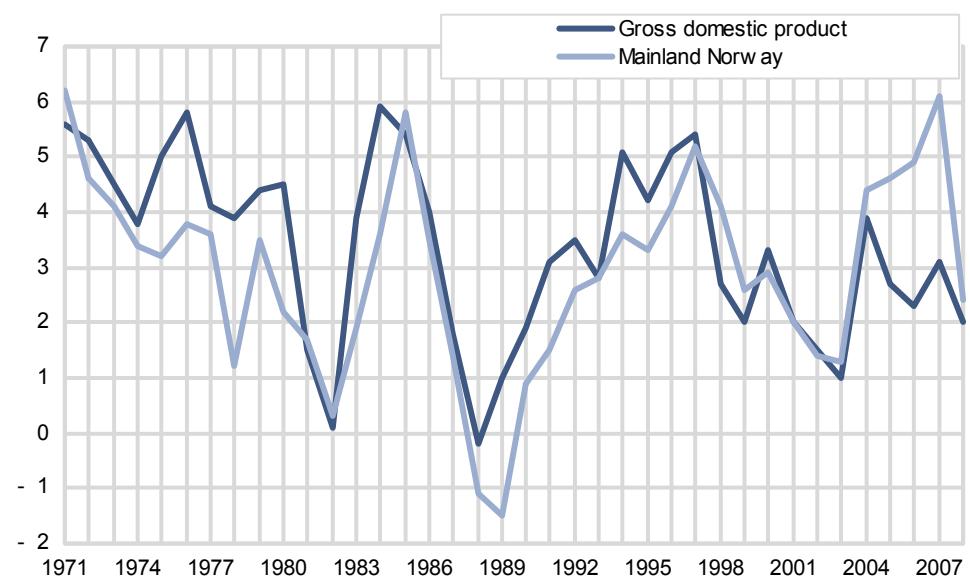

Figure 2 shows the annual percentage change in volume in gross domestic product for Norway and for mainland Norway during the years 1970-2008. Mainland Norway consists of all domestic production activity apart from the exploration of crude oil and natural gas, service activities related to oil and gas, transport via pipelines and ocean transport.

From 1970 to 2008, the average annual growth in the GDP in Norway was 3.4 per cent. Annual growth in volume was particularly high in 1971, 1972, 1975 and 1976, as well as during the mid-1980s and 1990s, with growth rates above 5 per cent.

The GDP growth rate has only been below 1 per cent twice during the whole period; in 1982 and 1988. The strongest growth was 5.9 per cent, both in 1976 and 1984.

Mainland Norway has had an average annual GDP growth of 2.9 per cent from 1970 to 2008. Growth for mainland Norway has generally been lower than for Norway as a whole. During the years 2003 to 2008 however, the GDP growth of mainland Norway has been considerably higher than the total GDP growth.

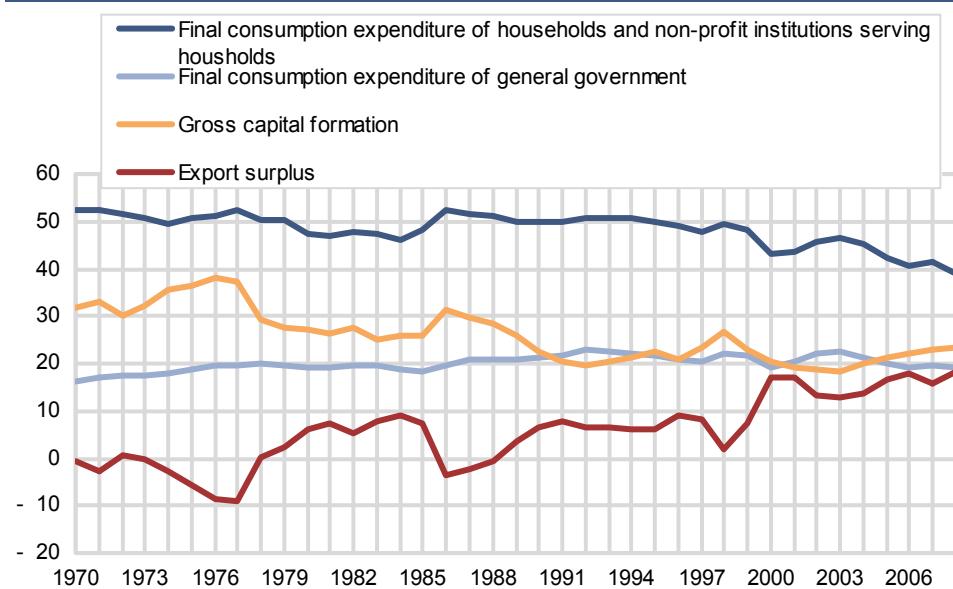

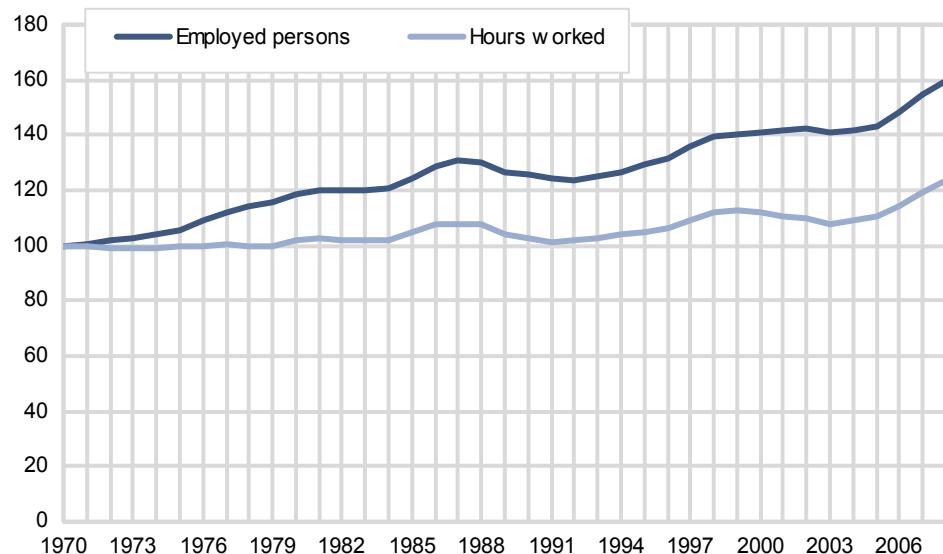

Figure 3. Gross domestic product - Expenditures. 1970-2008. Percentages

Figure 3 shows the final consumption expenditure of households and non-profit institutions serving households (NPISHs), general government, gross capital formation, and export surplus as a percentage of the total consumption expenditures from 1970 to 2008.

Households and NPISHs accounted for almost 40 per cent of total consumption expenditures in 2008. However, this share was higher during the 1970s but has diminished since then, especially in the last eight years. General government consumption expenditures remained relatively stable over the years, and peaked in 2003.

Gross capital formation as a share of total expenditures has varied over time, but has gradually accounted for a smaller share of the GDP until 2008. Massive investments in the petroleum industry during the 1970s contributed to strong growth in capital formation. In 1978, capital formation accounted for almost 40 per cent of total expenditures of the GDP. In 2008, 23 per cent of total expenditures were gross investment.

Since 1988, Norway has had a surplus in terms of external trade. In 2008, trade surplus was 18 per cent of total expenditures. This is strongly related to the development in the oil industry. Oil exports started in 1971, and in 1980 the export of oil and gas accounted for 80 per cent of total exports. In 2008, this share was 40 per cent.

Figure 4. Employed persons and total hours worked. 1970-2008. Indices. 1970=100

The number of persons employed in Norway increased by 60 per cent from 1970 to 2008, while the number of total hours worked increased by 24 per cent. The total number of hours worked per person per year has gone down by approximately 20 per cent since 1970. This development is related to a higher share of part-time workers, longer holidays, and a higher incidence of sick leave.

Part-time work became more common during the 1970s. This can be traced back to the entry of more women in the workforce. Many of the part-time employees are students, who normally work outside regular working hours.

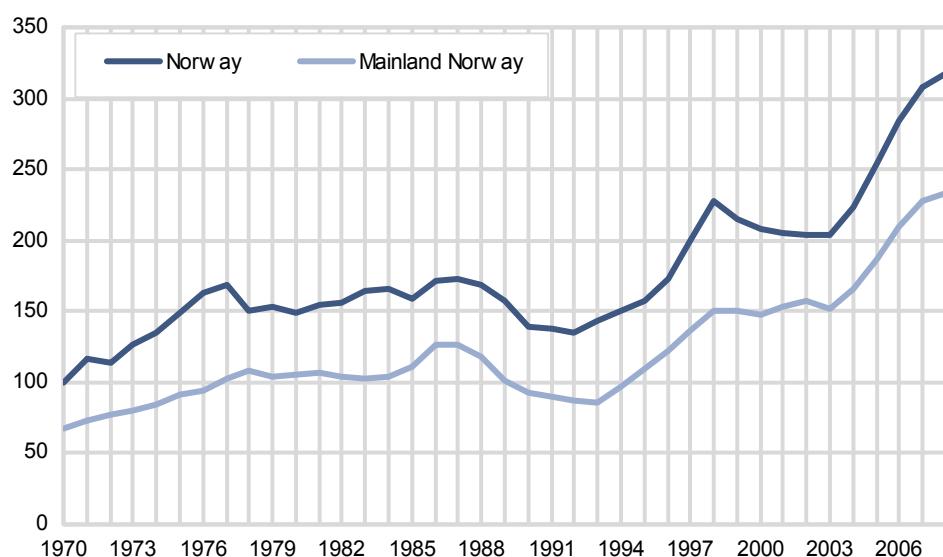

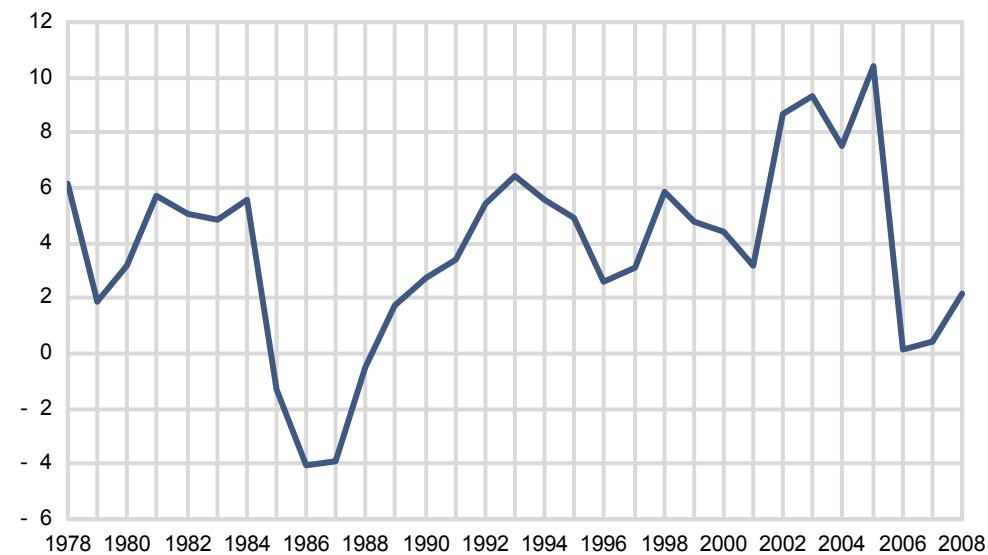

Figure 5. Gross fixed capital formation. Volume index. 1970=100.

Figure 5 shows the development in gross capital formation in Norway and mainland Norway from 1970 to 2008. The gross fixed capital formation has more than tripled in terms of volume during the period.

There was a strong increase in investments in the oil industry during the 1970s. In 1977, over 20 per cent of total investments were made in the oil industry, compared to 2 per cent in 1970. This increase flattened out after 1977. After the mid-1990s there was again a strong increase in the investments in the oil and shipping

industry. Investments in industry, housing and service industries contributed to an increase of over 50 per cent in investments in mainland Norway from 2003 until 2007.

Figure 6. Saving rate for households

The saving rate, defined as the proportion of savings to the disposable income, varied during the period 1978 to 2008.

The saving rate for households was positive up to 1984, but a high degree of loan-financed consumption led to a negative saving rate from 1985 to 1988. In 2005, there was a strong increase in the saving rate, with it reaching 10 per cent; the highest level during the period. The following year it fell dramatically to almost zero. This was a result of the introduction of a new tax on withdrawals of dividends. From 1 January 2006, taxes on the dividend incomes became equal to the taxes on the general income. This led to a sudden reduction in the withdrawals of dividends from approximately NOK 100 billion in 2005 to NOK 7 billion in 2006, and had a major impact on the saving rate.

2. Background and purpose

2.1. Purpose and history

The national accounts (NA) statistics are designed to provide a consistent and comprehensive survey of the overall national economy. The annual national accounts provide a summarised description of the economy as a whole and a detailed description of transactions between different parts of the Norwegian economy and between Norway and the rest of the world. The national accounts also provide information on capital stocks and employment.

The first national accounts for Norway based on modern principles were published by Statistics Norway in 1952. In the 1950s, national accounts figures were compiled back to 1865. Between 1960 and 1970, the national accounts were developed extensively and adapted to the international recommendations in the UN System of National Accounts 1968 (1968 SNA).

National accounts are used as a tool to compare the economic situation in different countries, and therefore it is important that national accounts in various countries are based on a common template. From time to time some adaptations or changes

are made to the common international recommendations for national accounts as a consequence of new economic phenomena or changes that occur in terms of reorganising the economy. This requires corresponding changes in the structure of the Norwegian national accounts. At different time intervals, new statistics are produced that entail a need to revise parts of the national accounts figures. Since one objective of the national accounts is to provide a picture of the developments over time that is as correct as possible, it is not possible to introduce such changes from one year to another. It is therefore necessary to carry out major revisions of the national accounts figures, so-called main revisions, in order to introduce adaptations due to new international recommendations or introduce new levels based on new statistical sources. As a part of these main revisions, the time series are revised so that the revised national accounts can give a consistent picture of economic developments over time. Pursuant to the EEA agreement, Norway is obliged to follow the European recommendations for national accounts in the European System of National and Regional Accounts (ESA). The current version is from 1995 (ESA95). This European framework for compilation of national accounts is consistent with the UN's framework for national accounts, System of National Accounts 1993 (1993 SNA), with regard to definitions, classifications and other principles, but has a stronger focus on the conditions and requirements for data in the European Union.

In the mid-1990s, Statistics Norway completed a new main revision of the national accounts. The first results from this main revision were released in the summer of 1995. New definitions and classifications were introduced in the accounts based on updated international guidelines of the 1993 SNA and ESA95. It had been more than 20 years since the last main revision. Consequently, it was also necessary to conduct a comprehensive examination of the sources and methods used in the national accounts.

Additionally, less extensive revisions were completed in 2002 and 2006. Main revisions of the national accounts are normally carried out every five years. A new main revision is to be published in 2011 in connection with the introduction of a new version of the international standard industrial classification (NACE).

2.2. Users and applications

The Norwegian national accounts provide an important source of information for the analysis of Norwegian society. Among other things, the national accounts show economic structures, and the level of the GDP related to the size of population gives some information about a country's welfare in relation to other countries. National accounts also provide important information about the economic development. The national accounts have many users, from pupils and students to public and private institutions that actively use national accounts figures in analyses of economic structures and developments. Among other things, central macroeconomic models are used in economic planning. The majority of these have been developed by Statistics Norway based on the annual national accounts figures. Other major users of the Norwegian national accounts data are the Ministry of Finance, Central Bank of Norway, research and development institutes (including Statistics Norway's research department), financial analysts and the media.

In addition, international organisations such as the IMF, OECD, World Bank, UN and Eurostat use the reported data in their statistics.

3. Statistics production

3.1. Population

The coverage of the national accounts is defined by international guidelines of the System of National Accounts 1993 (1993 SNA) published by the UN, OECD, IMF, World Bank, and the Commission of the European Communities in 1993, and the European System of National and Regional Accounts (ESA95) published by Eurostat/the EC Commission in 1996.

National accounts primarily describe the economic activity within the boundaries of a country, but the transactions with other countries are also included in the system. The distinction between the national economy and foreign countries is defined in terms of resident units. A unit is defined as a resident unit of the country when it has a centre of economic interest in the economic territory of the country - i.e. when it is involved in economic activities in this territory for an extended period of time (one year or more).

Two basic types of information are recorded in the national accounts: flows and stocks. Flows refer to actions and effects of events that take place within a given period of time, for example the output of an industry in one year. Stocks refer to positions at a certain point in time, for example the value of capital stock or the number of employed persons.

The national accounts comprise two basic statistical units: institutional units and local kind-of-activity units (establishments). Institutional units are economic entities that are capable of owning goods and assets, of incurring liabilities and of engaging in economic activities and transactions with other units in their own right. An institutional unit contains one or more local kind-of-activity units (local KAUs). The local KAUs are classified by type of activity. An activity is characterised by an input of products, a production process and an output of products. All local KAUs engaged in the same or similar kind-of-activity constitute an industry.

The national accounts consist of two main sets of tables; the supply and use tables (SUT) (also described as the real accounts) and the institutional sector accounts. The supply and use tables are consistent with the institutional sector accounts. The supply and use tables are based on local kind-of-activity units (KAUs). All local KAUs that produce the same or similar products constitute an activity. An activity is characterised by input of products, a production process, and final products. The institutional sector accounts are based on institutional units.

The supply and use tables in current and constant prices offer a structured overview of the supply and use of products (goods and services) in the economy. It shows where the goods and services are used in the economy. In addition, information on fixed assets, wages, hours worked, full-time equivalents and employed persons by industry is included. Furthermore, the supply and use tables provide the basis for the calculation of the Gross domestic product (GDP) and other central macroeconomic figures (see item 4.1). The annual growth rate in volumes and prices are calculated for most variables.

<i>Supply</i>	A central part of the national accounts is the description of the domestic output of goods and services. Domestic output is divided into about 190 industries in the final version of the annual national accounts, where each industry consists of enterprises characterised by almost identical production processes. All commercial activities in the economy are included in the national accounts, whether these are private or public, personal services, government services or other output-producing activities. The production boundary includes production of individual and collective services by government, own production of housing services by owner-
---------------	---

occupiers, production of goods for own final consumption, production of services by paid domestic staff and, in principle, illegal production and production for which the revenues are not declared to the fiscal authorities. Domestic and personal services produced and consumed within the same household fall outside the production boundary.

Each industry produces one or more types of goods or services. These goods and services are referred to as products, and the final version of the annual national accounts includes about 1 200 products. A homogenous product can be produced in more than one industry, but is characteristic only to one industry.

The annual national accounts also show the supply of products delivered from foreign countries as imported goods. Total supply is given by total domestic output and import. Import is not specified by industry, but is distributed by product. Import and export make up a central part of the Balance of Payments (BoP), which is fully consistent with the rest of the national accounts.

As a third aspect, there may be transfers of income to or from the government sector. These transfers, expressed by the sum of net product taxes (product taxes less product subsidies), are allocated to a number of products.

Use The use of goods and services is divided into final domestic use of goods and services and export. Export is defined as the part of domestic output that is sold abroad. For the part of domestic output that is exported, no further distinction between uses is made. Domestic use is divided into different categories: Intermediate consumption in the 190 industries, consumption, gross fixed capital formation in the industries and changes in stocks.

Products used for consumption may be used by households, non-profit institutions serving households (NPISHs) or general government. A part of the final consumption expenditure by general government is classified as individual consumption, since individuals consume this amount, but it is paid by general government. Examples of this type of individual consumption are government expenditure for products related to health care and education. The rest of the final consumption expenditure by general government is classified as collective consumption expenditure since this cannot be assigned to one individual. Examples are defence, public order and safety and other general public services.

A part of the total supply of a product is used as intermediate consumption by industries; i.e. they are either fully used in the production of other products (for instance electricity or other energy) or are processed into more refined products and resold.

A part of the total supply consists of capital goods. Households use some of this, and this forms one part of household consumption, but a large part is used by industries as a part of gross fixed capital formation and fixed assets.

In some cases, the total supply of a product is larger than the total use of the product. This results in a build-up of stocks. If the total supply of a product is lower than the total use, this results in the reduction of stocks.

Some results Value added is calculated for each industry as the difference between the output and intermediate consumption. Value added is distributed between various components, including the compensation of employees and operating surplus. The compensation of employees consists of wages and salaries paid to employees and social security costs.

Valuation Valuation is particularly relevant for transactions of goods and services, but also for the general aspect of registration (cf. cash values or accrual values, and other

principles for the recording of statistical data). The transactions of variables in the national accounts follow the accruals principle. Thus, taxes on production and subsidies are recorded as accrued values and not as recorded in the government accounts (taxes on production and subsidies in cash values).

In the description of the transaction of goods and services, several price concepts are used. Output is valued at basic prices, while the use categories, both intermediate consumption and final use, are valued at purchaser prices, including exports at FOB (free on board). Imports are valued at CIF (cost-insurance-freight). Basic prices mean that the corresponding taxes on products are deducted and subsidies on products are added to output recorded at producer prices. The principle of output at basic prices was introduced in 1993 SNA and ESA95 in order to achieve a standard valuation internationally and at national level.

The value added of an industry is "valued" at basic prices (calculated as output at basic prices less intermediate consumption at purchaser prices). The total value added of the industries is also "valued" at basic prices.

The GDP is "valued" at market prices, which means that taxes on products, including VAT, less subsidies on products, are added to the total value added of the industries at basic prices.

Institutional sector accounts

The Institutional Sector Accounts present data on all economic transactions that the institutional sectors are involved in, in addition to balance sheets.

The system is based on a sequence of interconnected flow accounts linked to different types of economic activity taking place within a given period of time, together with balance sheets. The sheets record the values of the stocks of assets and liabilities held by institutional sectors at the beginning and end of the period. Each flow account relates to a particular type of activity such as production and generation of income, allocation of primary income, secondary distribution of income, redistribution of income in kind, use of disposable income and accumulation.

The accounts are grouped into three categories: production and income accounts, accumulation accounts and balance sheets (opening and closing balance sheets). These categories are described below.

Production and income accounts

The production account records the activity of producing goods and services, i.e. all transactions directly related to production. Its balancing item, value added, is the difference between the value of output and intermediate consumption. It is a measure of the institutional sectors' contribution to the gross domestic product (GDP).

In the generation of income account, the balancing item between value added, consumption of fixed capital, compensation of employees and taxes (less subsidies) on production and imports is operating surplus, also called mixed income in the households.

Allocation of primary income account shows the remaining part of the primary distribution of income (the income generated from production). It records for each sector property income receivable and payable, compensation of employees receivable by households and rest of the world and taxes less subsidies on production and imports receivable by government. The balancing item for this account is balance of primary income.

The secondary distribution of income account shows the redistribution of the balance of primary income. It covers only the redistribution through transfers in

cash, such as current taxes on income and wealth, social contributions, social benefits and other current transfers. Its balancing item is disposable income.

The redistribution of income in kind account gives a more complete picture of the role of government. The redistribution of income in kind account is relevant only for the household sector, government sector and the NPISHs, due to the nature of the transactions concerned. The balancing item for this account is adjusted disposable income.

Use of disposable income account shows how disposable income is allocated between final consumption expenditure and saving for those sectors with final consumption expenditure, i.e. households, the NPISH and general government.

Use of adjusted disposable income account shows how adjusted disposable income is allocated between actual final consumption of government (collective consumption of government), actual final consumption of households and saving.

Accumulation accounts The accumulation accounts cover all changes in assets, liabilities and net worth.

The capital account records transactions linked to acquisitions of non-financial assets and capital transfers involving the redistribution of wealth. Non-financial assets include tangible and intangible fixed assets, inventories, valuables, as well as tangible non-produced assets, such as land, subsoil assets, water resources, and intangible non-produced assets such as patented entities etc. Capital transfers consist of transfers of ownership of assets without any counterpart being received in return. The balancing item of this account is net lending (if positive) or net borrowing (if negative).

The financial account records transactions on financial instruments.

In this publication, the only accumulation account presented is the capital account.

Balance sheets The opening and closing balance sheets display assets on one side and liabilities and net worth on the other at the beginning and end of the period. Assets and liabilities are valued at the prices on the date the balance sheets are established. Net worth is the balancing item of a balance sheet; the difference between assets and liabilities.

This publication does not include balance sheets for fixed assets by main activity or balance sheets for financial assets.

3.2. Data sources

The calculation of the final annual national accounts is prepared on a detailed basis with calculations for about 190 industries and 1 200 products (goods and services). The calculations are based on statistics from several different sources, such as the structural business statistics for manufacturing and other industries, accounting statistics for general government and enterprises, statistics for wages and earnings, external trade statistics, household consumer surveys and labour statistics. Some parts of the national accounts are compiled more or less directly from other statistics, while other parts are based on calculations and estimates.

The institutional sector accounts are mainly based on accounting statistics for general government and for enterprises, wage statistics and balance of payment statistics.

The methods and calculation system used to calculate annual and preliminary figures are basically the same as the system used to calculate quarterly national accounts (QNA). Preliminary national accounts figures are calculated based on the appropriate short-time statistics and on the structure of the most recent final annual

national accounts. When the preliminary version of the annual accounts is calculated, these are also utilised as a source.

3.3. Control and revision

The source data are critically evaluated and compared with alternative sources. In some areas, the statistics have to be adjusted in order to satisfy the requirements of the national accounts. In areas where the statistics are incomplete, evaluations are essential. In the process of estimating national accounts data, national accounts figures are critically re-evaluated and controlled in several steps.

3.4. Estimation

The process of compiling the annual national accounts starts with the calculation of independent supply and demand estimates for all goods and services at current prices. To some extent, source data are extracted directly from the databases and converted into national accounts codes and format. Other parts of the economy are based on more complex calculations, based on different statistical sources and/or assessments. Finally, supply and demand for each of these goods and services are balanced using supplementary information and quality assessments of the various statistical sources. This results in integrated supply and use tables in current prices.

As a part of the reporting responsibility to Eurostat, the Division for National Accounts documented the calculation methods for the final annual national accounts (see Norwegian National Accounts - GNI Inventory for ESA95).

First, detailed figures are calculated and balanced in current prices. Then the system calculates figures in constant prices, based on the detailed current price figures and corresponding price indices. The deflation (current values that are divided by price indices) takes place at the most detailed product level: a price index is allocated to each detailed product. The individual products are as price homogeneous as possible. Constant price figures in the annual national accounts are calculated using the price level of the previous year, which means that the base year is changed every year.

The deflation approach has two dimensions, (i) differentiated by main categories of supply and use (deflating output, imports, exports and implicitly for domestic use), and (ii) differentiated through valuation (deflating current values at basic prices by price indices and implicitly determining the other value components, including adjustments against values at purchaser prices). The method used to calculate constant figures, i.e. a separate deflation of output and intermediate consumption in order to arrive at value added at constant prices as a balancing item, through a detailed input-output framework (supply and use tables), is called double deflation.

Estimation of the annual institutional sector account differs somewhat from the procedure used for the supply and use table calculations. The institutional sector account is to a large extent based on existing information. For example, the production account distributed among different sectors in current prices is the exact mirror image of the production in the supply tables. The general government sector is covered by the accounts provided by the department of public finances, and the rest of the world is consistent with the balance of payments.

Calculations of the sectors' households and non-profit institutions serving households are based on information from several different sources. The production is covered by the supply and use tables, capital income and capital expenditure are covered by tax statistics, and taxes and subsidies are generated from counterpart information provided by the public administration.

The institutional sector accounts are measured in current prices. Volume figures are not suitable in this context because the institutional accounts are based on a

sequence of interconnected flow accounts. However, disposable income is deflated to measure the purchasing power.

3.5. Confidentiality

§ 2-6 of the Statistics Act states that under no circumstances shall data be published in such a way that they may be traced back to the supplier. This means that the general rule is not to publish data if there are fewer than three enterprises in an industry. Within the national accounts this principle of confidentiality is ensured by defining the detailed classification of industries in the national accounts so that an industry always consists of at least three enterprises.

§ 2-4 of the Statistics Act includes provisions for professional secrecy for the staff as well as other provisions regarding confidentiality and integrity.

4. Concepts and variables

4.1. GDP and production

Gross domestic product (GDP)

The GDP is an indicator for total value added in a country, and also an expression for gross income generated from domestic production. The GDP is measured in market prices, and is defined and compiled using three different main approaches (see the three sets of definitions below): the production approach (I), the expenditure approach (II) and the income approach (III).

(I)

- = Output (basic price) - Intermediate consumption (purchaser price) + Taxes on products - Subsidies on products
- = Output (producer price) - Intermediate consumption (purchaser price) + Taxes on imports + VAT + Customs duties
- = Total value added (basic price) + Taxes on products - Subsidies on products
- = Total value added (producer price) + Taxes on imports + VAT + Customs duties

(II)

- = Final consumption expenditure + Gross fixed capital formation + Changes in inventories + Exports - Imports
- = Final uses - Imports
- = Final domestic uses + Exports - Imports

(III)

- = Compensation of employees + Operating surplus + Consumption of fixed capital + Taxes on production - Subsidies on production

Mainland Norway

Mainland Norway consists of all domestic production activity except for exploration of crude oil and natural gas, service activities incidental to oil and gas, transport via pipelines and ocean transport.

Output

Value of goods and services from domestic production activities, i.e. from market production, production for own final use, and non-market production in general government and in NPISHs. Output of goods and services is not the same as sale of goods and services. Output is published in basic prices, i.e. subsidies on products are included, but not VAT or other taxes on products (see basic value).

In general government and other non-market production, output is estimated as the total of compensation of employees, net taxes on production, consumption of fixed capital and intermediate consumption.

Intermediate consumption

Value of the goods and services consumed as inputs in the production process, excluding fixed assets whose consumption is recorded as consumption of fixed capital.

More precise definitions are given in 1993 SNA and ENS95, especially on the borderlines against gross fixed capital formation and compensation of employees. Intermediate consumption refers to goods and services that are used, not purchased goods or services.

Taxes on products

Transfers from domestic producers to general government of taxes or excises that are payable per unit of a good or service produced or transacted. The most important taxes on products are the value added tax, excises on motor vehicles, tax on petrol and special taxes on alcoholic beverages.

Subsidies on products

Transfers from general government to domestic producers of subsidies that are payable per unit of a good or service produced. The most important subsidies on products are subsidies on research and development services, agricultural products and private education services.

Value added

Values added and gross income generated from domestic production in an industry or sector (or in total for all industries/sectors), derived and defined as output less intermediate consumption. Value added is published in basic prices, i.e. subsidies on products are included, whereas VAT and other taxes on products are not (see basic price).

In general government and other non-market activities, value added is compiled as the sum of compensation of employees, net taxes on production (taxes on production less subsidies on production) and consumption of fixed capital.

Market production, production for own final use and other non-market production

Market production covers output sold at prices that are economically significant or otherwise disposed of on the market, i.e. receipts exceeding production costs. Non-market production covers output where products are supplied free or at prices that are not economically significant. It also covers output produced for own final use.

The definitions of market and non-market production are clarified on the basis of certain criteria. Non-market production includes production in general government (except water supply and sewage and refuse disposal etc. in local government), production in the NPISHs and production for own final use. Production for own final use is distinguished, specifying separate industries, such as agriculture, hunting, fishing and owner-occupied dwelling services. Production in general government and production in the NPISHs are also broken down by industry.

Total supply

= Output (in basic prices) + Taxes on products - Subsidies on products + Imports
= Output (in producers' prices) + Taxes on imported products + Value added tax + Customs duties + Imports

4.2. Final use categories

Final use categories

Include final consumption expenditure (of households, non-profit institutions serving households (NPISHs) and general government), gross fixed capital formation, changes in inventories and exports.

Total final uses

= Final consumption expenditure + Gross fixed capital formation + Changes in inventories + Exports

Final consumption expenditure

- = Final consumption expenditure of households + Final consumption expenditure of NPISHs + Central government final consumption expenditure + Local government final consumption expenditure
- = Actual final consumption of households + Actual final consumption of general government

The first relation defines final consumption expenditure of the institutional sectors. The second definition adds up total actual acquisitions of consumer goods and services by households (irrespective of who is paying) and general government (collective consumption), respectively.

Government final consumption expenditure

- = Central government final consumption expenditure + Local government final expenditure
- = Actual individual consumption in general government + Actual collective consumption

Actual collective consumption

Consumption expenditure in general government that does not provide a mechanism for redistributing resources among individual households, such as general public services, defence, public order and safety, and industry-related affairs.

Household consumption expenditure of goods

Expenditure incurred (financed) by resident households on consumption of goods

Household consumption expenditure of services

Expenditure incurred (financed) by resident households on consumption of services. Household consumption expenditure of services should not be mixed up with household actual individual consumption that also includes consumption of services acquired by the households but financed by other sectors (general government, NPISHs).

Final consumption expenditure of the NPISHs

Expenditure incurred by non-profit institutions serving households on consumption goods and services. These expenditures are equal to output and measured as total production costs, i.e. as the sum of intermediate consumption (goods and services that the NPISHs use for their production purposes), compensation of employees (use of own labour), consumption of fixed capital (use of own production capital) and any other taxes on production, net, but less income from sale to other sectors. Final consumption expenditure of NPISHs is by convention all individual and used by households as actual final consumption. Final consumption expenditure of NPISHs is mainly financed through government budgets.

Local government final consumption expenditure

Expenditure incurred by local government on consumption goods and services. This expenditure is recorded as total costs of production, i.e. intermediate consumption (goods and services that local government uses for its production

purpose), compensation of employees (use of own labour force), consumption of fixed capital (use of own production assets), any other taxes on production, net, while deducting receipts from sales. Expenditures on consumption goods and services purchased from market producers and supplied directly to households are also included. Grants paid by local government to private day-care institutions for children are considered social transfers to households since local government finances part of these household services.

Local government final consumption expenditure consists of two main parts; collective (actual) final consumption of central government, and individual consumption expenditure of central government, which is also part of actual final consumption of households.

Central government final consumption expenditure

Expenditure incurred by central government on consumption goods and services. This expenditure is recorded as total costs of production, i.e. intermediate consumption (goods and services that central government uses for its production purpose), compensation of employees (use of own labour force), consumption of fixed capital (use of own production assets), any other taxes on production, net, while deducting receipts from sales. Expenditures on consumption goods and services purchased from market producers and supplied directly to households are also included, e.g. refunds related to purchases of pharmaceuticals, fees to physicians etc.

Central government final consumption expenditure consists of two main parts; collective (actual) final consumption of central government, and individual consumption expenditure of central government, which is also part of actual final consumption of households.

Household actual final consumption

= Household final consumption expenditure + Final consumption expenditure of NPISHs + Individual consumption expenditure of central government
+ Individual consumption expenditure of local government

Individual consumption expenditure is exclusively related to households (i.e. households only acquire individual consumption goods and services).

Gross capital formation

= Gross fixed capital formation + Changes in inventories + Net acquisitions of valuables

Gross capital formation as a term diverges from the similar term acquisitions of non-financial assets (see below), which is used to distinguish investment in non-financial assets from investment in financial assets (cf. net lending/net borrowing).

Net acquisitions of non-financial assets

= Acquisitions of non-financial assets - Consumption of fixed capital
= Gross fixed capital formation + Changes in inventories + Net acquisitions of valuables

Acquisitions of non-financial assets

Gross capital formation (including the value of non-produced non-financial assets)

Gross fixed capital formation

Value of acquisitions less disposals of new or existing fixed assets. Fixed assets consist of both tangible fixed assets (dwellings, other buildings and structures, other structures, transport equipment, other machinery and equipment, livestock for breeding etc., vineyards, orchards etc.) and intangible fixed assets (mineral

exploration including oil and gas, computer software, entertainment, literary or artistic originals etc.).

Changes in inventories

Value of entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories. Work-in-progress is included in changes in inventories, as well as work-in-progress on cultivated assets (single-use plants or livestock, and young fish, for subsequent slaughtering). Building of oil platform modules and building of ships are however not recorded as changes in inventories, but as gross fixed capital formation while the construction project is in progress (at accruals value).

Exports of goods and services

Value of goods and services to abroad, i.e. from residents to non-residents

Imports of goods and services

Value of goods and services from abroad, i.e. from non-residents to residents

Export surplus

See external balance of goods and services

External balance of goods and services

= Exports of goods and services - Imports of goods and services

Total uses

- = Final consumption expenditure + Gross fixed capital formation + Changes in inventories + Exports + Intermediate consumption
- = Total final uses + Intermediate consumption
- = Total domestic uses + Exports
- = Total final domestic uses + Intermediate consumption + Exports

4.3. Income components

Compensation of employees

= Wages and salaries + Employers' social contributions

Wages and salaries

Remuneration to employees in respect of work done in domestic production. Wages and salaries are both in cash and in kind. Wages and salaries in cash include overtime pay, and sickness and maternity allowances paid by employers. Wages and salaries in kind consist of goods and services, or other benefits provided free or at reduced prices by employers that can be used by employees at their own discretion. Wages and salaries in kind include, inter alia, the services of vehicles, low interest loans to employees and free transportation for employees in some transport industries.

Wages and salaries subsequently are distributed to households and to rest-of-the world (i.e. for non-residents employed with resident producers, inter alia, foreign nationals on Norwegian ships).

Employers' social contributions

Social contributions incurred by employers, paid to central government and to autonomous social security and pension funds as well as non-autonomous pension funds, including the following sub-items: employers' contributions to National Insurance, employers' other actual social contributions (contributions to the Public Service Pension Fund, Municipal Pension Funds, other social security schemes, and other social contributions), and in addition, employers' imputed social contributions. The latter item coincides with social benefits actually paid through

unfunded arrangements - from employers to present or former employees, for instance early retirement pensions.

Other taxes on production

Taxes (excluding taxes on products) that resident producers incur, and that are payable to general government, as a result of engaging in production, and which are not payable per unit of goods and services. The most important among other taxes on production are those linked to oil and gas extraction (royalty excise on extraction of petroleum etc).

Other subsidies on production

Subsidies (excluding subsidies on products) that resident producers may receive from general government, as a result of engaging in production, and which are not payable per unit of goods and services. The most important among other subsidies on production are those linked to agriculture.

Taxes on production

= Taxes on products + Other taxes on production

Subsidies on production

= Subsidies on products + Other subsidies on production

Operating surplus

Operating surplus in an industry is defined as:

= Value added – Compensation of employees – Other taxes on production + Other subsidies on production – Consumption of fixed capital

In the institutional sector accounts, operating surplus in a sector is defined similarly. For households, a major part of this is called mixed income. In the institutional sector accounts, this is surplus accruing from processes of production before deducting any explicit or implicit interest charges, rents or other property income payable on the financial assets, land or other tangible non-produced assets required to continue the production.

4.4. GNI and disposable income

Gross national income (GNI)

The GNI is the sum of gross primary incomes receivable by resident institutional units or sectors, (i.e. Norwegians and foreign nationals resident in Norway) from domestic production and property income, compensation of employees etc. from abroad, less property income, compensation of employees etc. paid to abroad. The GNI equals the sum of gross primary incomes of the sectors and is defined as:

= Gross domestic product (GDP) - Primary incomes payable to non-residents, net
= Gross domestic product (GDP) - Primary incomes payable to non-residents
+ Primary incomes receivable from non-residents

National income

= Gross national income - Consumption of fixed capital

Disposable income for Norway

= Gross national income - Consumption of fixed capital - Current transfers payable to non-residents, net
= Gross domestic product - Consumption of fixed capital - Primary incomes payable to non-residents, net - Current transfers payable to non-residents, net
= Saving for Norway + Final consumption expenditure

Primary incomes payable to non-residents, net

Net transfers to non-residents as income in the form of compensation of employees, interest, dividends etc. (and any taxes on production payable to non-residents), after deducting corresponding incomes receivable from non-residents. In former accounts, the term used was interest, dividends etc. to abroad, net. This item represents the difference between the GDP and GNI.

Current transfers payable to non-residents, net

All current transfers payable to non-residents on a net basis, excluding primary incomes. This item represents the difference between the GNI and gross disposable income for Norway.

External balance of current account

= External balance of goods and services + External balance of primary incomes and current transfers

External balance of primary incomes and current transfers

= Incomes receivable from non-residents - Expenditures payable to non-residents
 = Compensation of employees from non-residents + Interest receivable from non-residents + Dividends receivable from non-residents + Reinvested earnings receivable from non-residents + Other current transfers receivable from non-residents - Compensation of employees to non-residents - Interest payable to non-residents - Dividends payable to non-residents - Reinvested earnings payable to non-residents - Other current transfers payable to non-residents

4.5. Saving and investment

Saving for Norway

= Disposable income for Norway - Final consumption expenditure
 = Net lending/Net borrowing for Norway + Gross real investments + Capital transfers, net - Consumption of fixed capital

The first definition is the direct and standard definition. The second connects the financial account and the production and income accounts.

Saving of households

= Disposable income + Adjustment for the change in net equity of households in pension funds - Household final consumption expenditure

Saving of financial corporations

= Disposable income - Adjustment for the change in net equity of households on pension funds (the adjustment relevant for the sub-sector life insurance corporations and pension funds)

Acquisitions of non-financial assets

Gross capital formation (including the value of non-produced non-financial assets)

Net acquisitions of non-financial assets

= Acquisitions of non-financial assets - Consumption of fixed capital
 = Gross fixed capital formation + Changes in inventories + Net acquisitions of valuables

Capital transfers

Transfers, in which the ownership of an asset is transferred between sectors, or which require one or both parties to acquire or dispose of an asset, i.e. net transfers between sectors that are not considered current transfers. Regardless of whether they are cash or in kind, capital transfers should lead to a corresponding change in financial or non-financial assets shown in balance sheets for one or both parties

involved in the transaction. The most important among capital transfers are capital taxes and investment grants.

Net lending/net borrowing for Norway

- = Gross saving for Norway - Gross real investments - Capital transfers, net
- = Saving for Norway - Gross real investments + Consumption of fixed capital
- Capital transfers to non-residents + Capital transfers from non-residents
- = External balance on current account + Capital transfers from non-residents, net

Change in net financial assets for Norway

- = External balance of current account + Revaluations, net + Other changes in volumes, net
- = Closing balance of net financial assets for Norway - Opening balance of net financial assets for Norway

4.6. Fixed asset and consumption of fixed capital

Fixed assets

These are produced assets used repeatedly, or continuously, in processes of production for more than one year.

They consist of both tangible fixed assets (dwellings, other buildings and structures, transport equipment, other machinery and equipment, cultivated assets like part of livestock and orchards etc.), and intangible fixed assets (mineral exploration, computer software, originals in art etc.).

Inventories and valuables that are not used repeatedly in production are not recorded as fixed assets. The same is the case for tangible and intangible non-produced assets.

Consumption of fixed capital

Decline in the current value of the stocks of fixed capital as a result of physical deterioration, normal obsolescence and normal accidental damage.

4.7. Employment

Persons employed

Number of persons employed with resident producers. Persons employed include persons employed part-time, persons in military or civil services as conscripts, and persons temporarily on leave due to sickness, vacation, permission etc. Foreign employees (non-residents) engaged in domestic production, including foreign seamen on Norwegian-owned ships or ships rented from abroad.

Persons employed are given as an average value over a year (or quarter), and distributed by activity, gender and employee versus self-employed.

Full-time equivalents

Defined as the number of persons employed full-time, plus the number of persons employed part-time recalculated to full-time equivalent basis. Full-time equivalent persons are a concept of stocks like number of persons. The scope of hours worked by a full-time equivalent person is the same as the actual working hours for a full-time equivalent person. The number of hours worked per full-time equivalent person could vary between activities and over time.

Hours worked

Hours worked by employed persons (employees and self-employed) in domestic production during one year. The hours worked refer to production within effective

and normal working hours, with additions for overtime and deductions for absences due to sickness, leave of absence, vacations and any labour conflicts.

Hours worked are also influenced by the calendar effect (movable holidays and leap years). The number of working days can vary by up to three days from one year to a next.

5. Standard classifications

5.1. Accounting system of the national accounts

The accounting system of the Norwegian national accounts is based on the international standards for national accounts, i.e. 1993 SNA and ESA95. The accounting system outlines the framework and contents for the production of national accounts statistics. In addition to accounting structure, the accounting system contains a number of groupings or classifications used in the national accounts, the most important of which are described below:

5.2. Institutional sector classification

The Norwegian institutional sector accounts specify the main sectors, i.e. non-financial enterprises, financial enterprises, general government, households and "the rest of the world". They also provide sub-groupings of the main sectors.

Non-financial enterprises

Covers institutional units engaged in the market production of non-financial products and services.

The institutional unit consists of one or more legal entities. The Norwegian sector accounts provide the sub-sectors:

- Public enterprises, owned by central government
- Public enterprises, owned by local government
- Private non-financial enterprises

Financial enterprises

Covers institutional units mainly engaged in financial activities. The main sector is divided into the following sub-groups:

- Norges Bank
- Commercial Banks
- State lending institutions
- Unit trusts
- Life insurance companies
- Private and municipal pension funds
- Non-life insurance companies
- Financial ancillary corporations
- Other financial institutions

General government

Covers institutional units, which in addition to carrying out political responsibilities, provide and enforce regulations, produce public services (mainly non-market) and redistribute income and wealth. The main sector is divided into the following sub-groups:

- Central government
- Local government

Households

The basic function for the main sector "households" in the national accounts is to provide labour, to consume products and services, and to produce goods and services. Depending on the socio-economic characteristics, the household sector can be divided into the following sub-groups:

- Households consisting of persons receiving wages
- Households consisting of self-employed persons
- Households consisting of students, pensioners, joint households

Non-Profit Institutions Serving Households (NPISHs)

NPISHs are institutional units providing services to households. These units are mainly engaged in non-market production. The main income source for NPISHs are transfers from general government, membership fees and voluntary contributions.

The rest of the world

The rest of the world is treated as a fully integrated sector in the Norwegian sector accounts. The sector covers all foreign units that have transactions or economic relations with any Norwegian domestic institutional unit.

5.3. Activity classification

The activity classification used in the national accounts is based on the Norwegian Standard Industrial Classification, which is based on the EU standard adopted for ESA 1995, i.e. NACE.

5.4. Classification of non-financial assets and gross fixed capital formation

Non-financial assets are classified by type of aggregate as defined in 1993 SNA, such as tangible and intangible fixed assets, inventories, valuables, and non-produced assets, including tangible assets such as land, subsoil assets, water resources etc. and intangible assets such as patented entities, transferable contracts etc. It classifies the various types of non-financial assets according to the structure of these main items. This classification is more aggregated than the corresponding classification used for gross fixed capital formation by type. Gross fixed capital formation is grouped by main type within building and construction, machinery and equipment and transportation equipment.

5.5. Product classification

The product classification of the national accounts relates to aggregates of goods and services that are specified in the national accounts. The classification is based on the EU's central product classification CPA - *Statistical Classification of Products by Activity in the European Community* (Eurostat, 21.10.1992). The CPA groups products by activity, i.e. it defines characteristic products within each activity and connects them to the activity classification NACE Rev.1. The final annual national accounts include about 1 200 products, not including products that are introduced in the accounts for technical reasons (to ease the balancing process).

5.6. Classification of individual consumption by purpose

The classification of individual consumption by purpose is based on the international classification COICOP - *Classification of Individual Consumption by Purpose*, published by the UN.

5.7. Classification of the functions of government

The classification of the functions of government by purpose applies to all types of general government expenses, such as government final consumption expenditure,

gross fixed capital formation, subsidies, property income (i.e. expenses), capital transfers and other transfers for use in government financial accounts and in the national accounts. This classification is based on the international classification COFOG - Classification of the Functions of Government, published by the UN.

5.8. Classification of the purpose of non-profit institutions serving households (NPISH)

This is a minor purpose classification that applies to expenses of NPISHs. It is based on the international classification COPNI - Classification of the Purposes of the Non-Profit Institutions Serving Households, published by the UN.

6. Sources of error and uncertainty

The national accounts are based on various statistical sources. The sources are either survey data from establishments, enterprises or households, or data from registers. National accounts statistics reflect the inaccuracy in the statistical sources and the methods of compilation. Weaknesses and inaccuracies in the statistical sources are normally described in the documentation of the relevant sources.

Since the national accounts are an integrated system with balancing methods and consistency checks, the national accounts may reduce some of the inaccuracies in the statistical sources. On the other hand, national accounts require the compilation of statistics in areas where the sources are unsatisfactory, and the inaccuracy in such areas may therefore be significant. Some of the figures in the national accounts are estimated as residuals, and the uncertainty may be substantial in these areas. Examples are the compilation of changes in inventories and operating surplus by activity.

The EU Commission and Eurostat have completed a quality evaluation of the national accounts in all EEA countries. The conclusion was that "*The Norwegian national accounts are of a high quality, soundly based on reliable and exhaustive sources, integrated in a system with a detailed product breakdown*" (Report on the sources and methods used in compiling the GNP in Norway, Eurostat/B1/CPNB/237/EN, 9 December 1997, Luxembourg).

The International Monetary Fund (IMF) completed an evaluation of central parts of Norwegian macroeconomic statistics in autumn 2002, including the Norwegian national accounts. In the report IMF (2003), the Norwegian macroeconomic statistics, including the national accounts, got positive reviews: "*In summary, Norway's macroeconomic statistics are of generally high quality.*" With regard to the national accounts, the IMF also stated that: "*The source data for both the annual and the quarterly national accounts are generally sound and timely, and sufficiently portray reality.*" (Report on the Observance of Standards and Codes - Data Module; Responses by the Authorities and Detailed Assessment Using Data Quality Assessment Framework, IMF Country Report NO. 03/207).

The production of several of the sources that are used in the national accounts takes a considerable amount of time. Consequently, preliminary figures are more inaccurate than final figures.

7. Comparability and coherence

7.1. Comparability over time and space

Comparable figures are available back to 1970 for the supply and use tables, quarterly figures are available back to 1978. These time series are all based on

1993 SNA and ESA95. For the years 1865-1970, data based on the previous international guidelines are available.

For the institutional sector accounts, comparable figures are available back to 1978.

7.2. Coherence with other statistics

The presented figures are based on the international guidelines System of National Accounts (1993 SNA) and the European System of National Accounts (ESA 1995).

The Norwegian Balance of Payments (BoP) is an integrated system in the Norwegian system of national accounts, and the BoP figures are fully consistent with other NA figures. The quarterly national accounts (QNA), the institutional sector accounts, the regional accounts by county, as well as various satellite accounts (environment, tourism, health) are all based on the annual NA. These accounts are therefore fully consistent and compatible with the annual national accounts.

As mentioned in item 3.2, the national accounts are based on various statistical sources. The source statistics may not use the same definitions or groupings as the national accounts. Consequently, figures in the source statistics may be adapted or corrected before use in the national accounts. Published figures in the source statistics of certain industries may therefore not correspond to published figures in the national accounts.

8. Availability

8.1. Published figures

National accounts' supply and use tables are available at the following web address: http://www.ssb.no/english/subjects/09/01/nr_en/

Institutional sector account statistics are available at
http://www.ssb.no/english/subjects/09/01/nri_en/

8.2. Language

Norwegian national accounts are available in English and Norwegian.

8.3. Publications and other links

Statistics Norway: National Accounts – topic page
http://www.ssb.no/english/subjects/09/01/regnskap_en/
