

Aquaculture 2006

Official Statistics of Norway This series consists mainly of primary statistics, statistics from statistical accounting systems and results of special censuses and surveys. The series is intended to serve reference and documentation purposes. The presentation is basically in the form of tables, figures and necessary information about data, collection and processing methods, in addition to concepts and definitions. A short overview of the main results is also included

The series also includes the publications Statistical Yearbook of Norway and Svalbard Statistics

Preface

This yearly publication contains mainly statistics and facts about Norwegian fish farming, but figures from shellfish are also included. The Law of Aquaculture came into force June 2005. Due to this the title of this publication has changed from Fish Farming to Aquaculture. The material is divided into four subjects:

- Licences, labour input and stocks
- Production and economics
- Environment and health
- External trade

The material is based upon different sources. The main source is the information from statistical questionnaires filled in by the farmers themselves, collected by The Directorate of Fisheries. The Directorate of Fisheries presents preliminary figures every year. Statistics Norway, Division for External Trade, is the source of the figures on exports and imports.

The entire publication is presented on the web in PDF format, but the tables can be downloaded in Excel format. The web-address is:

<http://www.ssb.no/english/subjects/10/05/>.

Some of the tables are available in the StatBank Norway, as part of timeseries:
<http://www.ssb.no/statistikkbanken/>

This publication has been prepared by Senior Executive Officer Rune Skolbekken. Responsible for this publication is Head of Division Ole Osvald Moss, Division for Primary Industry Statistics.

5.4. Exports of salmon and trout, by type of product. 2004, 2005 and 2006.....	48
5.5. Exports of trout. Quantity and value. 1981-2006. Tonnes and NOK 1 000	49
5.6. Exports of trout. Quantity and value of sales to some selected countries. 1981-2006. Tonnes and NOK 1 000	50
5.7. Exports of trout, by type of product and country. 2005 and 2006. NOK 1 000 and per cent.....	51
5.8. Imports of salmon and trout. Quantity and value. 1971-2006. Tonnes and NOK 1 000	51

1. Introduction

Since the early 1970s fish farming has experienced a major development regarding both production and economy. From being a complementary agricultural occupation without any economic importance to Norway as a whole, fish farming became a new important coastal business. The increased production and exports, with the value of billions of Norwegian kroner, have contributed to the fact that farmed fish is among the most important domestic animals in Norway.

In the 1970s fish farming included salmon and rainbow trout as the only species. Later fish farming has included other species of fish, like cod and halibut, and especially cod has given great expectations for the future. Shellfish farming is still of marginal importance in Norway.

Information from the fish farmers forms the basis of the statistics. The authorities and organisations need statistics when they are planning and making decisions. The statistics are also useful in research and to the farmers themselves.

Statistics concerning fish farming were up to and including 1985, published in *Official Statistics of Norway (NOS) Salmon and Sea Trout Fisheries*. From 1986 to 1992 inclusive, the statistics were published in *NOS Fishing and Rearing of Salmon etc.* From 1993 to 2005, the statistics were published in *NOS Fish Farming*. As of 2006, the statistics are published in *NOS Aquaculture*.

1.1. Coverage

Atlantic salmon (*Salmo salar* L) and rainbow trout (*Salmo gairdneri* L) are emphasized in this statistics, but other fish species are also included. Other fish species are cod, charr, halibut, mackerel, eel, saithe and turbot. Farming of these species includes both commercial farming and feeding of fish caught wild.

In 2006 there were 1452 operating licences. In addition, there were 374 licenses operating with shellfish. The annual statistics are covering all operating licences.

The statistics are divided into four chapters:

- Licences, labour input and stocks
- Production and economics
- Health and environment
- External trade

1.2. Sources of data

Main sources

The main sources of data are the annual questionnaires from the Directorate of Fisheries, which are sent to the licensees. In this edition it comprises the licensees registered January 2007. In accordance to Norwegian legislation, the licensees are under an obligation to answer the questionnaires.

There are five different questionnaires dependent on type of licence:

- Fish for food/parent fish/FoU. 2006. Salmon, rainbow trout and trout.
- Hatcheries and/or fingerling production. 2006. Salmon, rainbow trout and trout.
- Fish for food. 2006. Other fish species than salmon and trout.
- Hatcheries and/or fingerling production. 2006. Other fish species than salmon and trout.
- Shellfish. 2006.

Each questionnaire has its own guidelines for filling in. For this edition the deadline for returning the questionnaires were 1 March or 25 March 2007, depending on the questionnaire. The questionnaires with their respective guidelines are presented in appendices A-E.

Statistics Norway co-operates with the Directorate of Fisheries and is entitled to suggest or comment on changes in the questionnaires. The Directorate of Fisheries is responsible for sending out, collecting and revision of the questionnaires.

Statistics of fish farming have been worked out since 1971. The first two years, Statistics Norway collected the questionnaires. As of 1973 the Directorate of Fisheries has been responsible for the collection. The Directorate of Fisheries presents annual preliminary statistics. During the whole period Statistics Norway has been responsible for preparing and publishing the final statistics.

Up to and including 1992, Statistics Norway has carried out quality control and correction of data. During the last years The Directorate of Fisheries has taken over some of this work. In addition, they have the professional responsibility of the bulk of the quality controls.

First, local fishery authorities collect and control all the questionnaires. This control is based on both local and professional knowledge. The Directorate of Fisheries carries out further control on data concerning salmon, rainbow trout and trout. For each type of questionnaire there has been prepared a list, which contains absolute and possible errors. These lists are constructed on the basis of professional skills and evaluations. On some occasions, when doubts arise, the respondents are contacted.

At Statistics Norway the data are controlled once more previous to the making of tables and the preparing of the publication. The Directorate of Fisheries is consulted if any changes take place.

External trade Statistics Norway, Division for External Trade, produces statistics of external trade. In this publication, the statistics of salmon and trout are adapted and presented. The publication contains data from 2006, and the statistics are built upon custom declarations.

Other sources In addition to the sources mentioned above, this publication also contains facts and statistics from other sources. Statistics Norway has consequently had no influence on how the data material have been collected and processed.

The Directorate of Fisheries each year publishes a profitability survey of Norwegian fish farms, salmon and trout. A sample of representative fish farms and hatcheries are asked to provide certain keynumbers related to the operation and information that are important to the economy in the farm.

The Directorate of Fisheries has the Register of aquaculture licences, which includes where the licences are localized and the ownership.

1.3. Concepts

Aquaculture is the production of aquatic organisms. Production is any measures taken to enhance living organisms' weight, size, number, characteristic or quality.

A licence for aquaculture is a permission to farm fish given in accordance to Norwegian legislation (Aquaculture Act). Only operating licences are included.

A licence is considered operating if it has registered any labour input.

The different types of licence are:

- Fish for food. Salmon, rainbow trout and trout.
- Parent fish. Salmon, rainbow trout and trout.
- FoU (Research and Education). Salmon, rainbow trout and trout.
- Fry/fingerling. Salmon, rainbow trout and trout.

- Fish for food and fry/fingerling combined. Other fish species than salmon, rainbow trout and trout.
- Shellfish.

The owner of the licences sends in a form depending on type of licence. Individuals, joint-stock companies and other associations might have licence for aquaculture. The licences can be sold and one company can control more than one licence.

Fish for food is adult fish that is to be consumed. In the statistics, information from the parent fish licences and FoU licences is nevertheless included with the information from the fish for food licences, and are presented under the term "Fish for food".

Parent fish is the name of a fish that is used to produce roe and milt in artificial fecundation.

FoU is a licence for aquaculture given for the purpose of experiments, research or instructions.

Fingerling is the name of the fish when it has started assimilation. It is fed in the farm with the purpose of either to become fish for food or to be put in watercourses. Fingerlings of salmon, rainbow trout and trout are defined as fish that is fed over a period of time. The length of the fish varies from 2-4 cm up to approximately 25 cm.

Fry is the name of the fish during the period from hatching to the time it starts to assimilate nutrition (2-4 weeks).

Smolt is the name of the fish that is ready to enter the sea. At this time it changes in shape and colour and becomes shiny.

Value. Value-added tax is not included in the tables. The value is current value. The value is first-hand value, except of export and import value.

Quantity is quoted as round weight, except of exported and imported quantity, which is quoted as product weight.

Round weight is the weight of the fish before it is gutted. Fish that is delivered gutted is converted into round weight. In 2006 the conversion factor was: for fish gutted with head 1.125 and for fish gutted and decapitated 1.2857.

Cost of production per kg is the sum of smolt costs, feeding costs, insurance costs, wages and salaries, estimated depreciation, other operating expenses and net financial expenses divided to production of fish (round weight).

Feed conversion ratio is the amount of dry feed used in kg/increase in biomass in kg (wet weight).

Meaning: How much feed is needed to increase the biomass with 1 kg.

Operating margin

Operating profit*100 / Operating revenues.

Where operating profit is the difference between operating revenues and operating expenses.

1.4. Errors and inaccuracy

Data collection and processing errors

Statistical data might contain errors. The data from the farmers are of varying quality. In all likelihood the most important error is that some respondents might have given faulty or wrong information.

Concerning loss of fish, the respondents specify the numbers by cause. There is reason to believe that the specification is encumbered with errors.

Incorrect revision might depreciate the quality of the data. Errors might also have arisen during the processing at Statistics Norway.

Editing

The Directorate of Fisheries manually controls each questionnaire. The control is based on knowledge of the industry, and also calculations. When the information is registered in the database, the data is checked for errors in the registration.

Every year the Directorate of Fisheries makes an analysis of the profitability in fish farming of salmon and trout. Figures from the analysis are compared to, and controlled against, comparative data from the questionnaires used in the aquaculture statistics.

The routines of revision imply several controls revealing possible and absolute errors. The possible errors are revealed when the variables are outside intervals constructed on the basis of professional assessment. If such intervals are constructed wrongly or/and with a bias in any sense, compared to the reality, it will certainly depreciate the quality of the statistics.

1.5. Interpretation of data

Comments

A considerable part of the licences is operated in joint operation. A licensee might also hold more than one licence of similar type. As a result, some of the licensees give an account of information from more than one licence on the same questionnaire. It is impossible to separate some of this information. It implies that the counted *number of licences* in some tables is somewhat lower than the real number.

The majority of the tables are presented by county. The counties Østfold, Oslo, Akershus, Hedmark, Oppland, Buskerud, Vestfold, Telemark, Aust-Agder and Vest-Agder are combined. The numbers from these counties are of much smaller extent and will not be compared individually with the other counties.

The current commodity numbers in the export and import tables are presented in appendix F.

Because of rounding off, there are some differences between the total and the sum of the single components in the tables.

1.6. Additional information

Related statistical publication/Internet

Preliminary figures for 2007 will be published in August 2008 on the website of Statistics Norway. The web-address is: <http://www.ssb.no/fiskeoppdrett/> or in the StatBank Norway: <http://www3.ssb.no/statistikkbanken/>

Special requests

In addition to the tables published, Statistics Norway can be requested for more detailed statistics.

2. Licences, labour input and stocks

2.1. Licences

(tables 2.1-2.2, 2.4 and figure 2.1)

At the beginning of the 1970s fish farming was an industry that supplemented agriculture along the Norwegian coast and had little economic value for the country. Since at that time the fish farmers had one licence each, the number of licences was equal to the number of aquaculture licences.

When licences were issued for raising salmon, rainbow trout and trout in the sea for consumption (1985) no one was permitted to have a majority in more than one facility, and up until 1991 a company could have only one licence. It was also required that the owner should be local. In 1991 the Fish Breeding Act was amended and the rules for ownership liberalized. This resulted in a sweeping restructuring of the industry. Acquisitions and the concentration of ownership of licences in the form of mergers resulted in increases in the value of licences as well as bankruptcies.

An aquaculture licence means a permit from the authorities, and requires permits pursuant to the Aquaculture Act, the Fish Diseases Act, the Pollution Control Act and the Harbour Act. In addition, applications are to be evaluated in relation to the interests of conservation, recreation, fishing and wildlife.

In the Directorate of Fisheries' Register of aquaculture licenses as of 31 December 2006, 998 licences were registered in the areas of fish for food/parent fish/R&D (salmon, rainbow trout and trout). This was approximately the same as in 2005. There were 272 hatchery and fingerling licences (salmon, rainbow trout and trout) and 688 licences for fish species other than salmon, rainbow trout and trout. Of these, 909, 227 and 316, respectively, were in operation in 2006.

At the end of 2006, 42.5 million cubic metres of water in the sea were used for farming salmon, rainbow trout and trout for consumption. This corresponds to 46 695 cubic metres per licence in operation.

Utilized volume for farming species other than salmon, rainbow trout and trout was close to 1.9 million cubic metres at the end of 2006. This is the sixth straight year with a large increase in average cubic metres per licence from the previous year, and once again the highest ever recorded.

As of January 1st 2005 a standard licence for food for fish is not measured in cubic metres anymore. Instead, the new regulation, regulation of December 22nd 2004, sets an upper limit of 25 kg/m³ for salmon and trout.

2.2. Labour input

(tables 2.1-2.3 and figures 2.2-2.3)

There has been a trend toward increasing efficiency in the production of farmed fish in the last decade. This is illustrated by the fact that more and more is produced per man-hour, while at the same time the employment has dropped. This trend however, stopped in 2006, when 3990 persons were employed, which are 329 more than in 2005. In the same decade, however, the employment in the farming of other marine species has more than doubled.

Fish farming is a male-dominated occupation. In 1995 a percentage of 89.2 of the total number of hours spent in the production of salmon, rainbow trout and trout was performed by men. In 2006 this percentage was 91.4 per cent.

2.3. Stocks

(tables 2.5-2.7 and figure 2.4)

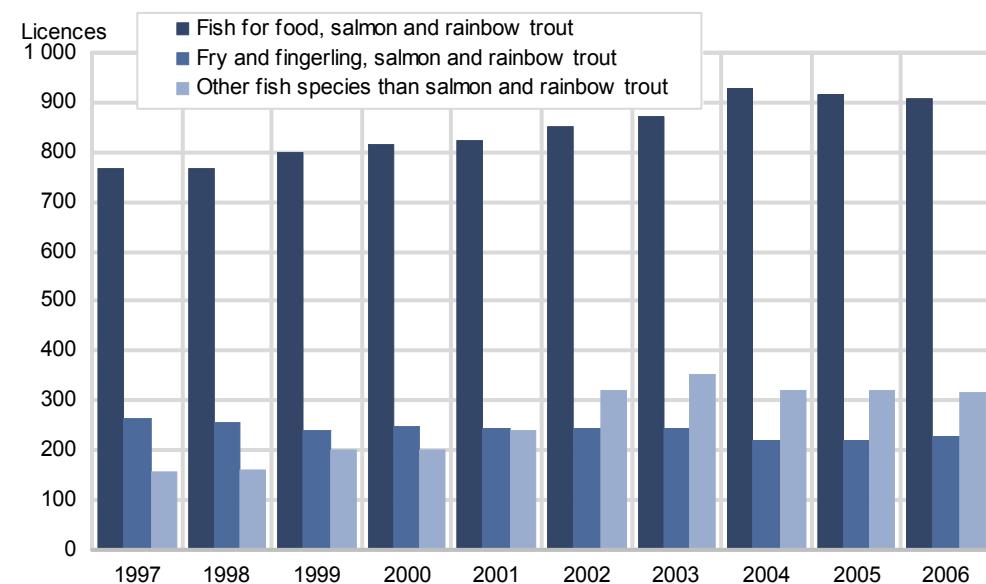

At the end of 2006 there were 241 million salmon in net cages. This is up 17.8 per cent from the beginning of the same year. 186.7 million salmon were set out, whereas 125.3 million were delivered for sale and 31 million were lost in some form of loss/wastage. Loss/wastage amounted to 7.8 per cent of stocks at the beginning of the year including what were set out during the year. Nordland was the county with the largest stock of salmon at the end of 2006.

The stock of rainbow trout in net cages at the end of 2006 was 32.3 million. This is up 28.8 per cent from the beginning of the same year. Whereas 27.7 million rainbow trout were set out, 16.7 million were delivered for sale, and 3.6 million were lost in some form of loss/wastage. Hordaland was the county with the largest stock of rainbow trout at the end of 2006.

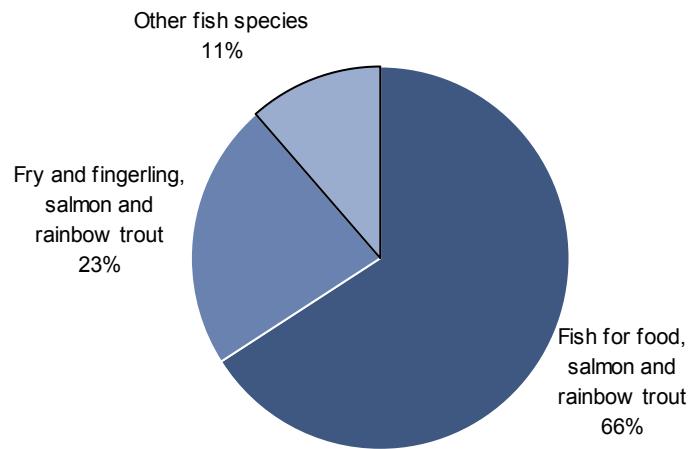

The leading cause of wastage/loss of salmon for consumption is disease in the net cages. In 2006, 26.4 million individuals were reported as dead fish. Another important cause is escaping. In 2006 a number of 920 000 salmon escaped from fish farms, which is the largest number ever reported. It is up almost 30 per cent from the previous year (see the chapter on health and the environment) and 67 per cent more than in 2004. Disease is also the leading cause of wastage/loss of rainbow trout for consumption.

Wastage in hatcheries totalled 79 million salmon, whereas the figure for rainbow trout was nearly 13 million

3. Production and economics

Norwegian aquaculture is subsidy-free and of great importance for employment in some rural coastal regions. Even though the quotas on fish feed apparently dampened the growth, there has been ample growth and optimism in the industry. As of January 2005 the quotas on fish feed was replaced by regulations on Maximum Permitted Biomass.

3.1. Production

(tables 3.1-3.8 and figures 3.1-3.6)

In 2006, Norway was the ninth-largest aquaculture nation in the world, with a production of 709 000 tonnes (source: FAO). China was by far the largest producer in aquaculture, with an annual production of 34 429 000 tonnes. This was 67 per cent of the world's total production in 2006.

Salmon is the main reason that Norwegian aquaculture has experienced the upsurge of the past 25 years. Nevertheless, until 1976, more rainbow trout than salmon were sold annually. Successful breeding efforts, salmon's adaptation to domestication and ample demand in the market have meant that salmon comprised a whopping 88.9 per cent of the total slaughtered amount of farmed fish in 2006.

Early in the 1990s the annual growth in the sale of slaughtered salmon was much higher than it was at the end of that decade. The quantity of salmon sold for consumption increased by 30.0 per cent from 1993 to 1994, while the corresponding sales increased by approximately 7 per cent from 2005 to 2006. After some bad years in the beginning of this decade the ex-farm value of salmon rose to NOK 15.6 billion in 2006, an increase of 27.9 per cent over 2005. This was the highest ex-farm value ever for the second year running. The average ex-farm price rose strongly from NOK 20.77/kg in 2005 to NOK 24.73/kg in 2006.

In 2001 and 2002 the sales of rainbow trout rose to new heights, but then fell again. 62 703 tonnes were sold in 2006, up 6.5 per cent from the previous year. The ex-farm value was close to NOK 1.6 billion, up 25.8 per cent from 2005. This was the highest ex-farm value ever. The average ex-farm price increased from NOK 21.34/kg in 2005 to 25.18/kg in 2006.

The most salmon was sold in Nordland county, with over 131 000 tonnes, while Hordaland was the leader in rainbow trout, with its 23 000 tonnes.

The farming of species other than salmon and rainbow trout is not yet anywhere near experiencing the upswing that farming of the aforementioned two species has seen.

Cod, however, keeps showing promising figures. In 2006, 11 087 tonnes of cod were sold, valued at over NOK 261 million. The value is up 66 per cent from 2005, and an enormous 262 per cent compared to 2004.

In 2006, the sales of halibut were 1 185 tonnes, the same as in the previous year. The halibut was valued at NOK 71 million.

There were sold 3 749 tonnes of shellfish, valued at over NOK 21.5 million, in 2006. Mainly blue mussels were sold.

With regard to smolt, in 2006 almost 177 million salmon and over 23 million rainbow trout were sold for setting out in the sea (including internal deliveries),

while almost 187 million salmon and 28 million rainbow trout were bought and received internally.

3.2. Economics

(tables 3.9-3.12 and figures 3.7-3.9)

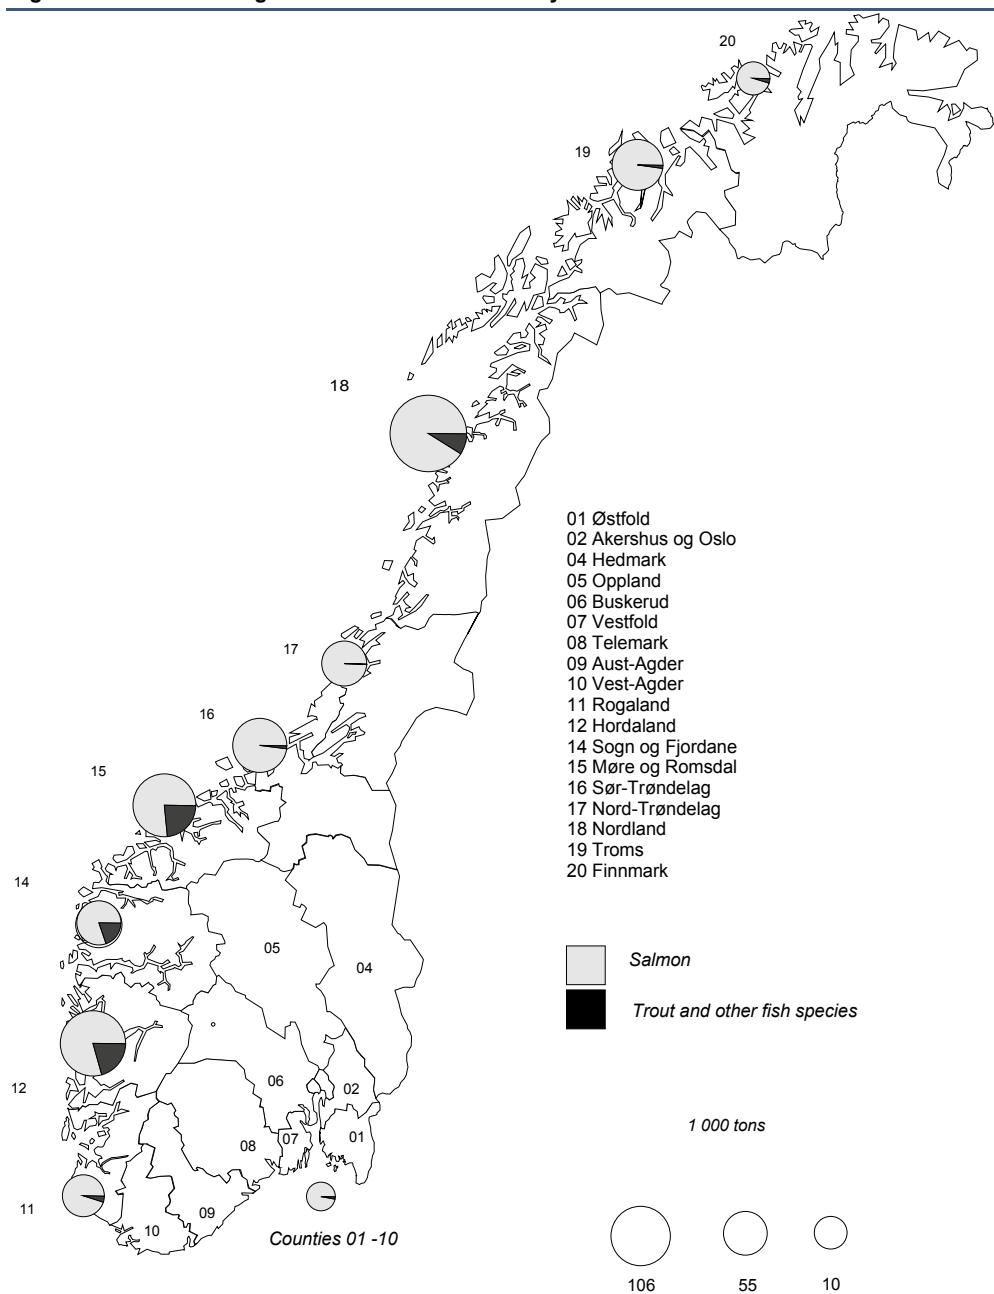

Economically this decade did not start well for companies raising fish for consumption, but the trend turned yet again in 2004. The Directorate of Fisheries has calculated that aquaculture companies in 2006 had an overall profit before tax of over NOK 5.9 billion, with an operating margin of 30 per cent. In 2005 the overall profit was in the range of NOK 3.2 billion, with an operating margin of 23 per cent. This improvement in profit can be explained with a change in the market for the better with higher prices for salmon and rainbow trout (source: The Directorate of Fisheries. Profitability Survey, 2006).

Throughout the years the average production costs have fallen at the same time as sales of salmon and rainbow trout have risen. However, the costs rose from NOK 13.80/kg in 2005 to NOK 14.74/kg in 2006. This was due to higher feeding costs and the item "other operating expenses". Feeding costs are the largest costs connected with the production of salmon and rainbow trout for consumption. In 2006 the average feeding costs per kilogram were NOK 8.36. This amounted to 56.7 per cent of total costs per kilogram of fish produced, marginally up from 2005. Wage costs and smolt costs in 2006 comprised 9.7 and 10.7 per cent, respectively, of the total costs.

The considerable growth in the production of farmed fish has, as expected, led to an increasing consumption of feed. This is why the production of salmon for consumption and use as parent fish, until 31.12.2004, has been limited by feed quotas. As of January 2005 there are no quotas but regulations on Maximum Permitted Biomass instead. In 2006 domestic sales of dry feed supplied by the Norwegian Fish Feed Producers Association (FPF) and imported feed totalled 988 000 tonnes, an increase of 9 per cent over 2005.

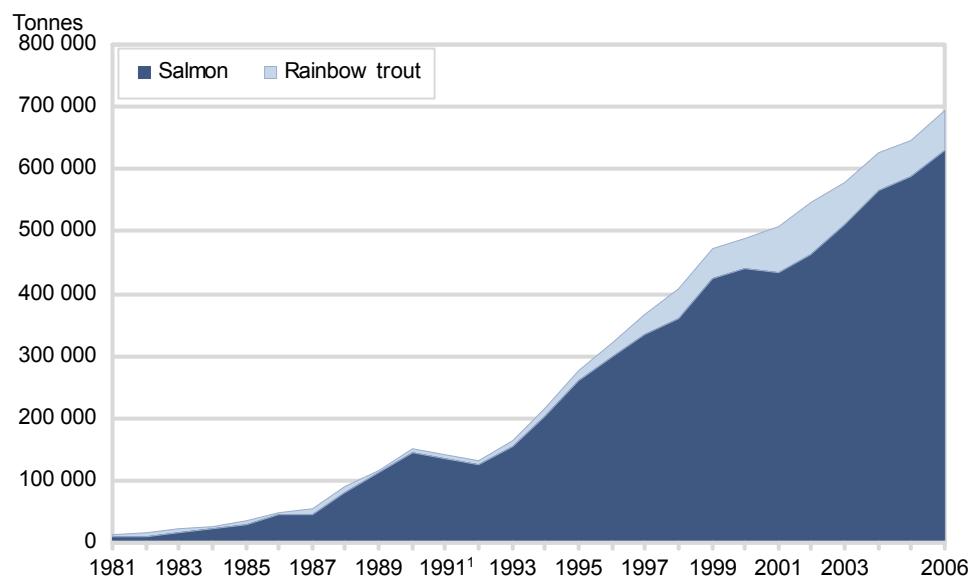

Feed conversion ratio is used to get an idea about feed utilization. The feed conversion ratio in 2006 was 1.19, the lowest since 1996 (source: Profitability Survey, 2006).

Investments increased yearly up to 2001, and then fell again until 2004. However, in 2005 the investments rose heavily and almost NOK 1.6 billion was invested in 2006. A healthy economy in the previous year can explain this, as well as changes in productions and a new regulation with requirements to the technical standard of installations.

4. Environment and health

In this chapter we focus on the most important problem areas when it comes to environment and health:

- * Escaping
- * Diseases
- * Pharmaceutical products
- * Chemicals
- * Organic materials

4.1. Escaping

(table 2.7-2.8)

Norway has a special international responsibility for preserving wild Atlantic salmon. The escaping of farm salmon that interbreed with wild salmon is thus considered a serious problem. Since the production of farmed salmon in Norway is thousand times as large as the catch of wild salmon (source: Directorate for Nature Management report 2008-05), the effects of even a low escape rate may be considerable. Some also believe that the official figures for escaping are lower than the actual figures, because of the underreporting of minor sporadic escapes/“trickle” escapes.

Damage or wreckage in bad weather is the chief cause of major escapes. In 2006, the registered number of escaped farm salmon and rainbow trout was about 935 000, up more than 29 per cent from previous year. This was the largest number (i.e. registered escapes) ever. Troms followed by Nordland had the largest registered number of escaped farm salmon in 2006.

For figures on fishing for escaped farm fish, see NOS Salmon and Sea Trout Fisheries 2006.

4.2. Diseases and pharmaceutical products

(tables 4.1-4.4 and figure 4.1)

Figures for the incidence of disease in salmon farming are based on figures from the National Veterinary Institute Norway.

The disease situation for farmed fish has improved in recent years. This is amply illustrated in the reduced use of *antibiotics*. In 2006 the total number of 1 478 kg was sold, a slight increase from 2005, but compared to 1987 this is a decline of 97 per cent. In 1987, 0.9 grams were used per kg of fish produced, while in 2006 antibiotics use was reduced to 0.002 grams per kg of fish produced. Improved operating routines and vaccination are believed to have contributed to this development. All medicines used in Norwegian aquaculture are prescribed by veterinarians, and all medicine sales in Norway take place through approved pharmacies. This means reliable statistics.

Salmon lice

Besides escaping, one of the biggest problems today is connected with salmon lice. The salmon louse is a parasite that specifically targets salmonids, which in Norway means salmon, sea trout and rainbow trout. Salmon lice have a negative impact on farmed fish and wild salmon alike. Infested farmed fish suffer reduced growth and quality, and the annual loss to aquaculture due to salmon lice is estimated to be NOK 300-500 million (source: Official Norwegian Reports 1999:9).

Although many also claim that wild fish in the areas with large numbers of farmed fish are harmed because of the higher incidence of salmon lice, much is uncertain in this and one should be careful in drawing any conclusions.

There are chemical as well as biological treatments for salmon lice.

<i>Chemical</i>	When treating salmon lice the fish is bathed in water to which various delousing agents have been added, <i>bath treatments</i> with neurotoxins (organophosphates and pyretroids). One can also use delousing agents to the feed, <i>oral delousing</i> (salmon feed containing toxins targeting salmon lice). A historical overview of the use and sales of anti-parasite agents for treating farmed fish is presented in table 4.2.
<i>Biological</i>	Biological treatment, consisting of using wrasse, is an alternative to chemical solutions to the problem of salmon lice. The wrasses, which are placed in the net cages, eat lice continuously at temperatures above 6-7 °C. Since 2001 the number of wrasses has been reduced. In 2006 there were bought, or captured by the farmers themselves, close to 700 000 wrasses for use in aquaculture. The value was almost NOK 2.2 millions. In 2001 2.3 million wrasses was used, at a value of over NOK 10 millions.

4.3. Chemicals

(figure 4.3)

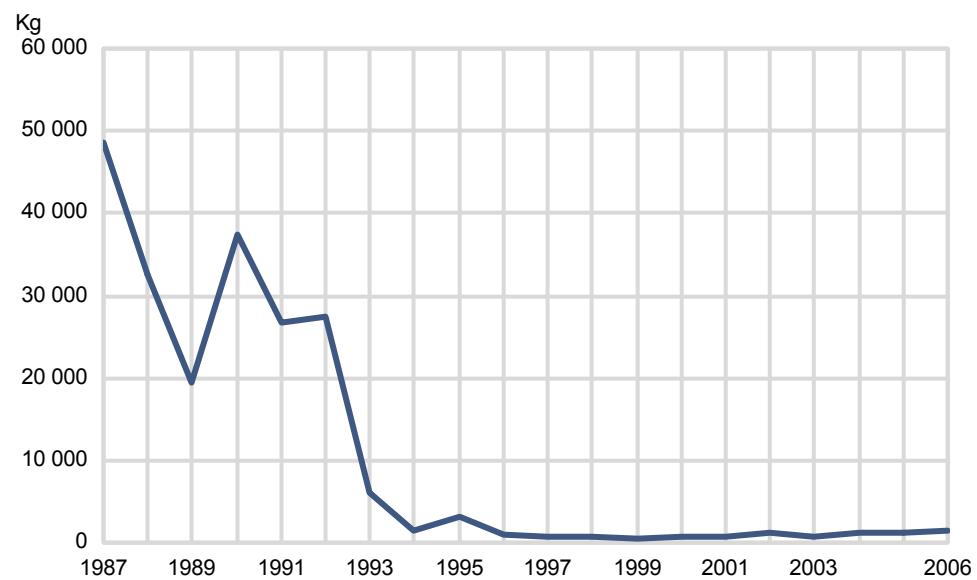

Copper (copper oxide, Cu₂O) is used for coating aquaculture nets to prevent organisms from fouling the nets. By far most (80-90 per cent) of copper discharged from aquaculture leaks out into to sea from the nets. The rest comes from net cleaners and producers of antifouling agents. Copper ions are acutely toxic to a number of marine organisms. Report to the Storting no. 58 states that discharges of copper from antifouling agents are to be reduced substantially before 2010 at the latest. The Norwegian Pollution Control Authority has revised their figures, and in 2006 a total of 812 tonnes of copper were sold, the highest ever. In 2005 a total number of 670 tonnes of copper were sold. The lack of reduced sales may be seen in connection with a lack of alternative solutions and better reporting. The increasing use of copper for coating nets has led to chemical use receiving higher priority (source: Directorate for Nature Management report 1999-1).

4.4. Release of organic materials

(figure 4.2)

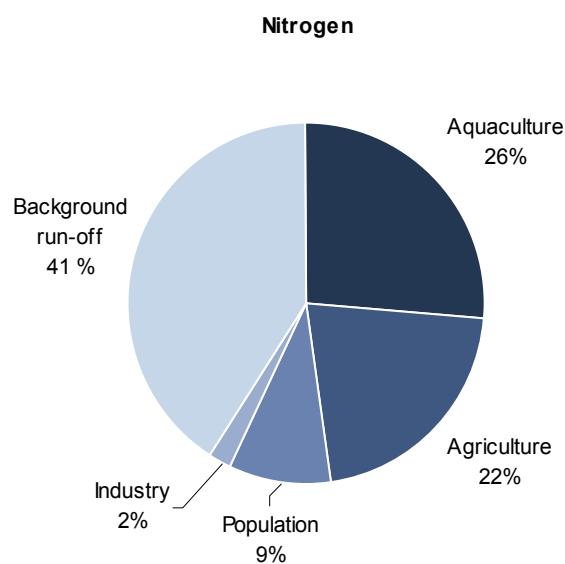

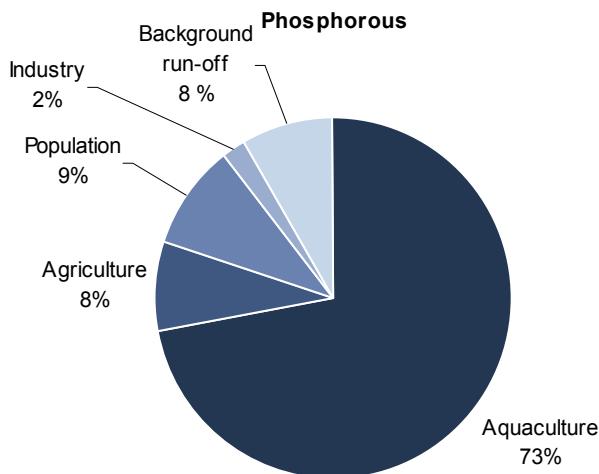

The growing production of farmed fish is adding significant quantities of organic materials/nutrient salts to coastal areas. Quantifications, by means of a model, made by Norwegian Institute for Water Research (NIVA) says that aquaculture in Norway released 7 353 tonnes of phosphorous into to sea in 2006, whereas nitrogen release totalled 34 789 tonnes. This was 19 per cent more phosphor and nitrogen than in 2005. Nutrients released into the water from fish farms come from excrement and remains of feed. The majority of the discharged phosphorous and nitrogen goes out into the surrounding waters and is dispersed throughout the recipient. Along the Norwegian coast, aquaculture was by far the largest contributor in releasing phosphorous into the sea ($\frac{3}{4}$ of the total input). The release of nitrogen from aquaculture represented more than $\frac{1}{4}$ of the total input, and increased more than the release from agriculture (source: NIVA).

5. External trade

5.1. Exports

(tables 5.1-5.7 and figures 5.1-5.3)

Norway is the world's largest producer of salmon and rainbow trout (Norway raises only Atlantic salmon, though several species of Pacific salmon are raised in other countries). Norway is also by far the largest exporter of farmed salmon and rainbow trout. Although its principal market is the EU, Poland, Russia and Japan are also important markets. 530 000 tonnes of salmon and rainbow trout were exported in 2006, up 3 per cent from the previous year. The value was NOK 18.3 billion, up more than 24 per cent.

In 2006 Norway exported over 492 000 tonnes of salmon (product weight) valued at NOK 17 billion. This is the highest quantity and value ever. Salmon exports increased by 4.4 per cent by quantity and 26 per cent by value over 2005.

It was France, Denmark, Poland and United Kingdom that imported the most salmon from Norway in 2006. France's imports increased 9 per cent, while Denmark's imports rose by 7 per cent from 2005 to 2006. Russia's imports fell by close to 31 per cent, as a result of their restrictions on Norwegian imported fish. The quantity of salmon to EU countries increased from 2005 to 2006. The share of exports of salmon to EU countries also increased.

In 2006 the export value of *whole salmon, fresh and frozen* amounted to 83.1 per cent of the total value of salmon exported, as compared to 82.2 per cent the previous year. Processed products stood for 16.9 per cent of the export value in 2006. Russia alone received almost half of the export of *whole salmon, frozen*, while EU's share was halved. The export share of fresh salmon fillets to the EU dropped marginally from 84.9 per cent in 2005 to 83.5 per cent in 2006. Germany had the largest export share of frozen salmon fillets.

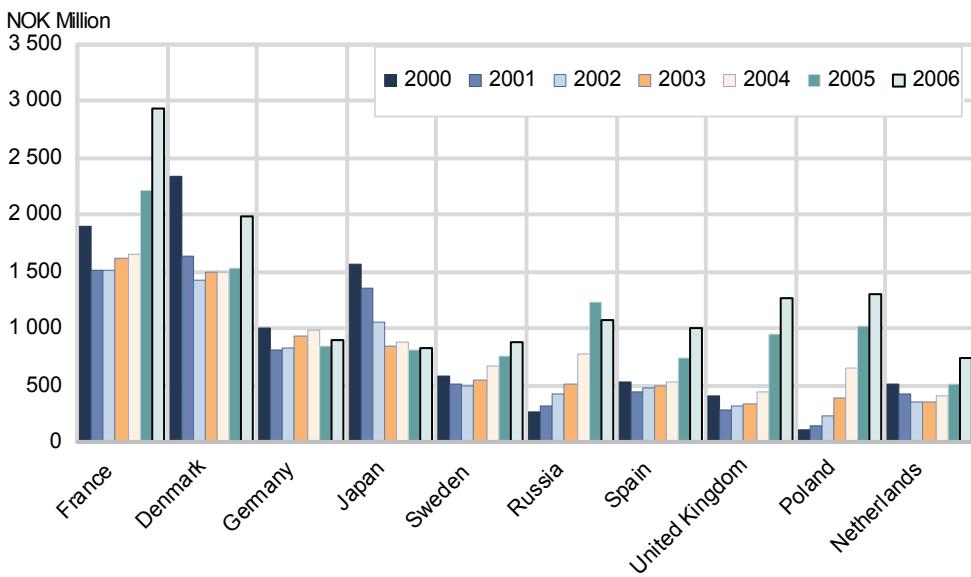

In 2006 Norway exported a total of over 38 000 tonnes of rainbow trout (product weight) with a value of NOK 1.3 billion. Rainbow trout exports dropped by 13.4 per cent by quantity, but increased by 5.6 per cent by value compared to 2005. The drop is mainly caused by a decrease in exports to most countries, and especially Russia and Japan. Russia and Japan accounted for close to 66 per cent of the export value, while they in 2005 accounted for 78 per cent. The share of rainbow trout exports going to EU countries increases considerably again from 5.6 per cent in 2005 to 10.1 per cent in 2006.

Norway exports rainbow trout chiefly as whole, frozen. In 2006 its share was 72.6 per cent of the total export value of rainbow trout.

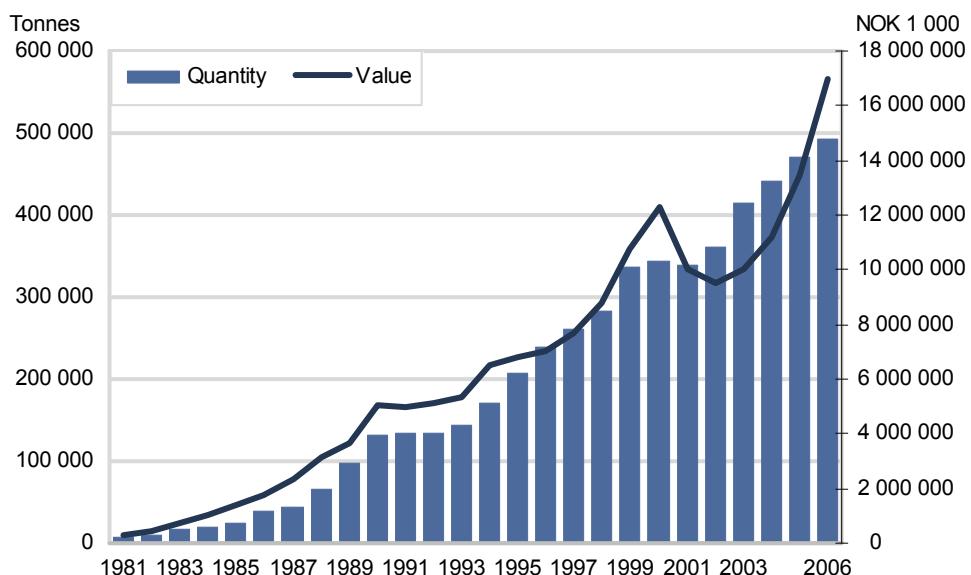

5.2. Imports

(table 5.8)

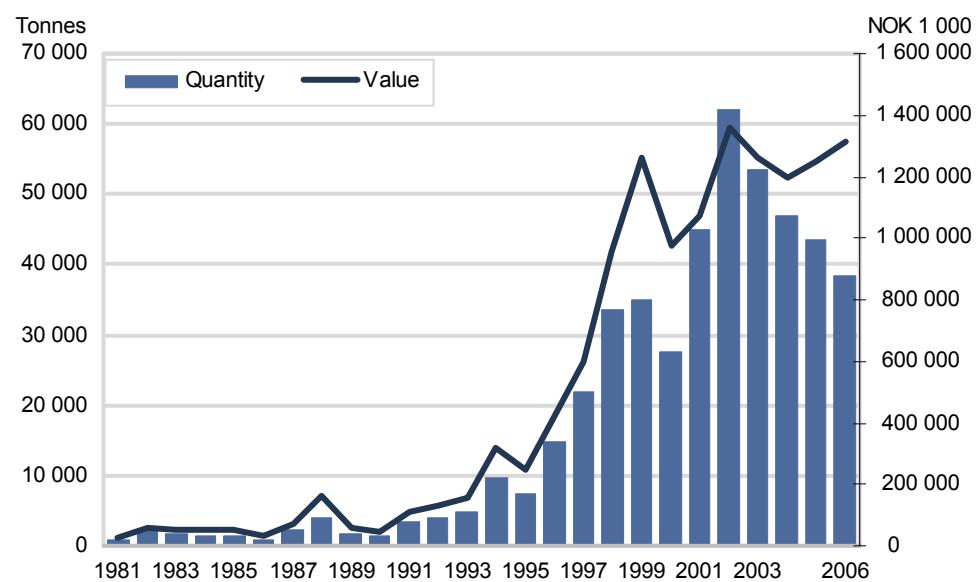

Norway imported 2 325 tonnes of salmon and rainbow trout in 2006. The value was more than NOK 117 millions.

¹ Up to and including 30 September 1990 The Federal Republic of Germany. ² Per 31 December 1990 12 174 tonnes, per 31 December 1991 200 503 tonnes and per 31 December 1992 4 000 tonnes of frozen fish were stored in transit in Denmark, Sweden and Germany. As some of these quantities may have been re-exported, the distribution by country is uncertain.

STATISTIKK FOR AKVAKULTUR 2006

RETTLEDNING TIL UTFYLING AV SKJEMA FOR

MATFISK- /STAMFISK- /FoU TILLATELSE

ATLANTISK LAKS, REGNBUEØRRET OG ØRRET

Forhåndsutfylte opplysninger.

Som det fremkommer av vedlagte skjema er en del størrelser forhåndsutfylt. Sjekk at opplysningene er korrekte. Dersom feil, stryk over og sett inn riktige opplysninger. Tomme/Blanke felt må fylles ut.

Navn, adresse og organisasjonsnummer

Selskapets navn, organisasjonsnummer og tillatelsesnummer(e) er forhåndsutfylt. Sjekk at de forhåndsutfylte opplysningene stemmer overens med egne opplysninger. Dersom opplysningene er uriktige eller mangler, ber vi om at dette rettes opp.

Det er ikke adgang til å slå sammen opplysninger som går over fylkesgrenser. Det er heller ikke adgang til å slå sammen to selvstendige selskaper (med to organisasjonsnumre). Angi øverst på skjemaet om det har vært drift i selskapet i 2006.

Benyttet kapasitet i selskapet.

Størrelsen er forhåndsutfylt i henhold til oppgitte opplysninger per 31.12. i den månedlig luse- og biomasserapporteringen. Dersom opplysningen er uriktig, vennligst oppgi korrekt reelt volum per 31.12.

Tabell 1. Produksjonsoversikt for atlantisk laks, regnbueørret og brunørret/sjørret (antall)

Opplysninger om beholdning per 1.1., utsett, uttak og beholdning per 31.12. er forhåndsutfylt i henhold til oppgitte opplysninger i den månedlige luse- og biomasserapporteringen. Det er fullt mulig å korrigere forhåndsutfylte opplysninger dersom det viser seg at opplysningene ikke er korrekte. Vær oppmerksom på at:

$$\text{beholdning per 1.1.} + \text{utsett} - \text{uttak} - \text{svinn/tap} = \text{beholdning per 31.12.}$$

Beholdning per 31.12. skal være lik summen av antall fisk oppgitt i tabell 2. Dersom endringer foretas i beholdning per 31.12. i tabell 1 skal også beholdningstallene i tabell 2 korrigeres.

Tabell 2. Beholdning per 31.12. av atlantisk laks, regnbueørret og brunørret/sjørret (antall og gjennomsnittsvekt pr. stk)

Opplysningene er forhåndsutfylt. De forhåndsutfylte opplysningene er basert på innrapporterte opplysninger til den månedlig luse- og biomasserapporteringen. Opplysningene skal korrigeres dersom beholdning per 31.12. i tabell 1 endres.

Tabell 3. Kjøp og interne mottak av settefisk/smolt

Totalt inntak er forhåndsutfylt, og er hentet fra innrapporterte opplysninger til den månedlige biomasse- og luserapporteringen. Totalt inntak skal være identisk med utsett i tabell 1.

Vi ønsker å få totalt inntak fordelt på kjøp og interne mottak. I tillegg ønsker vi å få oppgitt verdibeløp. Under interne mottak skal en oppgi mengde i stykk og reelt beløp i kroner selv om dette ikke er ført opp som kjøp i eget regnskap.

NB! Dersom selskapet også har klekkeri-/settefisktillatelser, skal interne mottak i dette skjemaet være lik interne leveranser på settefiskskjemaet.

Tabell 4a. Salg av fisk (levende og slaktet)

Salg av fisk (i kilo) skal oppgis i sløyd eller rund vekt. Beløpet oppgis i kroner. Salget skal fordeles på art.

Tabell 4b. Salg og interne overføringer av rogn

Salg og interne overføringer av rogn i 2006. Salget skal oppgis i antall stykk, eventuelt liter. Beløp oppgis i kroner. Salget skal fordeles på art.

Tabell 5. Generelle opplysninger

Leppefisk: Her ønsker en svar på om selskapet har kjøpt/selvfanget leppefisk i 2006. Dersom svaret er ja, skal en notere ned antall i stykk og pris i kroner.

Frossenfisk: Dersom selskapet hadde frossenfisk på lager (NB! ikke omsatt) per 31.12.2006 ber en Dem oppgi antall kilo fordelt på atlantisk laks og regnbueørret.

Tabell 6. Tap/svinn av fisk (stykke og samlet vekt)

Her skal tap/svinn i tabell 1 fordeles på 5 ulike hovedårsaker. Disse er:

Død fisk:	Antall døde fisk som er tatt opp av merdene.
Utkast fra slakteri:	Antall fisk oppgitt fra slakteri som utkast.
Rømming:	Antall fisk som har rømt fra merdene.
Annet:	Antall fisk som er tapt som følge av predatorer, tyveri og andre uforklarlige årsaker.
Tellefeil:	Justering av antall fisk i henhold til opprinnelig utsett. Eks. Dersom sortering/utslakting viser et høyere antall fisk enn opprinnelig registrert ved utsett, skal differansen føres inn som et positivt tall. Motsatt ved et lavere antall fisk, da skal differansen føres som et negativt tall.

Tabell 7. Arbeidsinnsats

Her angir en antall personer og antall timer, fordelt på fast ansatte, sesongarbeidere og kjønn, som er brukt på tillatelsen(e) i 2006. Ubetailt arbeidsinnsats skal også noteres.

NB! Kun arbeidsinnsats knyttet til oppdrettsvirksomheten, ikke arbeidsinnsats i eget slakteri o.l.

Tabell 8. Kjøp og salg av varige driftsmidler

Kjøp: Her skal både nye og brukte, varige driftsmidler (levetid 1 år eller mer) som er innkjøpt i 2006 tas med.

Salg: Ved salg av varige driftsmidler gis oppnådd salgspris.

Merknader og kommentarer.

Noter tillatelser som selskapet har samdrift med, men som ikke er ført på dette skjema.

Alle summer skal være eksklusiv merverdiavgift.

STATISTIKK FOR AKVAKULTUR 2006

RETTLEDNING TIL UTFYLLING AV SKJEMA FOR

KLEKKERI-/SETTEFISKTILLATELSE

ATLANTISK LAKS, REGNBUEØRRET OG ØRRET

Forhåndsutfylte opplysninger

Selskapets navn, organisasjonsnummer, tillatelsesnummer og beholdning per 1.1.2006 (tabell 1 og 2, 1. kolonne) er forhåndsutfylt. Dersom noen opplysninger skulle være feil eller mangle, ber vi om at dette korrigeres opp.

Drifts- og selskapsopplysninger

Angi øverst på skjemaet om det har vært drift i selskapet i 2006. Vi ønsker også opplyst om selskapet hadde egen stamfisk per 31.12.2006.

Tabell 1. Beholdning av yngel per 1.1.

Antall yngel per 1.1.2006 er forhåndsutfylt i henhold til oppgitt mengde per 31.12. på fjarårets skjema. *Sjekk at forhåndutfylte opplysninger er korrekte. Dersom feil stryk over og sett inn riktig beholdning.*

Tabell 2. Produksjon fra rognkorn til yngel

I kolonne 1 er beholdning av rognkorn per 1.1.2006 er forhåndsutfylt i henhold til oppgitt mengde per 31.12. på fjarårets skjema. *Sjekk at forhåndutfylt opplysninger er korrekt. Dersom feil stryk over og sett inn riktig beholdning.*

I kolonne 2 og 3 føres all innkjøp eller interne mottak av rogn i 2006. *NB! i disse kolonnene føres både kjøp av rognkorn fra andre settefiskprodusenter og mottak av rogn fra egen stamfisk.* Antall oppgis i 1 000 stk og beløpet i 1 000 kr. Vær oppmerksom på at interne leveranser som ikke blir ført som *kjøp* i regnskapet skal legges til *kjøp* med mengde og *reelt beløp*.

I kolonne 4 skal beholdning av rognkorn per 31.12.2006 fylles ut. Kun rognkorn som *ikke er klekket* per 31.12. skal oppgis (er alle rognkorn klekket i løpet av året skal beholdningen per 31.12. være lik 0).

I kolonne 5 føres antall yngel som er klekket i løpet av 2006 av beholdning av rogn per 1.1. og innkjøpt rogn i 2006.

Tabell 3. Salg og interne leveranser av rognkorn

Vi ønsker å få oppgitt salg og interne leveranser av rognkorn. Rognkorn beløp oppgis i 1 000 kr og rognkorn i 1000 stk.

Tabell 4. Kjøp og interne mottak av yngel og settefisk

Oppgi kjøp av yngel fra annen settefiskprodusent og egenproduksjon. For atlantisk laks ønsker vi opplysingene fordelt på klekket i 2006 og klekket *før* 2006. Husk å ta med eventuell egenproduksjon av yngel for hele 2006 også.

Tabell 5a. Salg og interne leveranser for utsett i sjø (smolt og settefisk)

Her ønsker vi å få oppgitt salg og interne leveranser av smolt/settefisk for utsett i sjø i 2006. Husk å krysse av hvorvidt yngelen er vaksinert

Tabell 5b. Salg og interne leveranser for utsett i ferskvann (yngel)

Her ønsker vi å få oppgitt salg og interne leveranser for utsett i ferskvann. Mengde oppgis i 1000 stk og beløp i 1 000 kr. Husk å krysse av hvorvidt smolten/settefisken var vaksinert før salg/intern leveranse.

Tabell 6. Tap/svinn av yngel

Her ønsker vi å få oppgitt tap/svinn i produksjonen av yngel. Tap/svinn skal fordeles på 5 ulike årsaker. Disse er:

Død fisk:	Antall døde yngel som er tatt opp av karene.
Destruksjon:	Antall yngel som er tatt opp og destruert.
Rømming:	Antall yngel som har rømt.
Annet:	Antall yngel som er tapt som følge av andre årsaker.
Tellefeil:	Justering av antall yngel i henhold til klekking/kjøp. Eks. Dersom sortering viser et høyere antall yngel enn opprinnelig registrert ved klekking/kjøp, skal differansen føres inn som et positivt tall. Motsatt ved et lavere antall yngel, da skal differansen føres som et negativt tall.

Tabell 7. Beholdning av yngel per 31.12.

Her ønsker vi oppgitt beholdning av yngel per 31.12.2006

Kontroll: Beholdningen per 31.12. fremkommer ved å summere siste kolonne i tabellene 1, 2 og 4 og trekke fra summen av siste kolonne tabellene 5a , 5b, og 6

Tabell 8. Arbeidsinnsats

Angi hvor mange personer og antall arbeidstimer, fordelt på fast ansatt, deltidsansatte og kjønn, som er brukt på tillatelsen(e) i 2006.Ubetalt arbeidstid skal også noteres. *NB Kun arbeidsinnsats knyttet til oppdrettsvirksomheten oppgis, ikke arbeidsinnsats ved annen virksomhet for eksempel matfiskproduksjon.*

Tabell 9. Kjøp og salg av varige driftsmidler

Kjøp: Her skal både nye og brukte, varige driftsmidler (levetid 1 år eller mer) som er innkjøpt i 2006 tas med. Med varige driftsmidler mener en alle driftsmidler som har en levetid på 1 år eller mer, både aktiverte og direkte utgiftsførte.

Salg: Ved salg av varige driftsmidler oppgis oppnådd salgspris.

Merknader og kommentarer

Noter tillatelser som selskapet har samdrift med og som ikke er ført på samme skjema.

NB! Alle beløp skal være eksklusiv merverdiavgift.

---------------------------------	----------	---

STATISTIKK FOR AKVAKULTUR 2006

RETTLEDNING TIL UTFYLLING AV SKJEMA FOR

ANDRE ARTER ENN LAKS OG ØRRET

MATFISKTILLATELSE

Forhåndsutfylt opplysninger

Selskapets navn, organisasjonsnummer og tillatelsesnummer(e) mv. er forhåndsutfylt. Dersom noen opplysninger skulle være feil eller mangle, ber vi om at dette rettes opp.

Drifts- og selskapsopplysninger

Angi øverst på skjemaet om det har vært drift i selskapet i 2005 og/eller i 2006.

NB! Har selskapet flere tillatelser må vi ha opplysninger om hvor mange av tillatelsene som ikke var i drift i 2006.

Tabell 1. Kjøp og interne mottak av settefisk og "småfisk"

Her ønsker en oppgitt antall settefisk, klekket yngel, som er innkjøpt i 2006. Angi antall innkjøpt yngel, og hvor mye dette innkjøpet kostet selskapet (beløp i kroner). Er fisken kjøpt fra andre føres den opp med antall og verdi (kr) i kolonnene for kjøp. Er det interne mottak (selvfisket) føres fisken opp med antall og verdi settes til kr 0.

Med benevnelsen "klekket yngel" mener oppdrettet yngel klekket i fangenskap. Når det gjelder "villfanget fisk" mener en fisk som er fanget og som holdes i merdene en periode for å komme opp i optimal slaktevekt. For eksempel snurrerevadfanget småtorsk.

Tabell 2. Salg og intern leveranse av rogn og slaktet fisk

Salg av rogn skal oppgis i liter og beløp i kroner. Salg av slaktet fisk oppgis i kilo (rund vekt) og beløp i kroner. *NB! Har selskapet uttak av fisk i tabell 3 (stk), skal den føres som slakt i tabell 2.*

Tabell 3. Beholdning av fisk

Beholdning av fisk per 1.1.2006 er forhåndsutfylt i henhold til oppgitt mengde per 31.12. på fjorårets skjema, *Sjekk at de forhåndsutfylte opplysninger er korrekte. Dersom feil stryk over og sett inn riktig beholdning.*

I kolonnen "Utsatt" skal antall fisk utsatt i 2006 oppgis. Antall skal stemme overens med kjøp/interne leveranser i tabell 1. I kolonnen "Uttak" skal uttak (slaktet) fisk i 2006 føres. I kolonnen "Svinn" skal totalt tap/svinn i 2006 føres, og i kolonnen "Beholdning" skal beholdning per 31.12.2006 føres. Antall oppgis i stykk. I siste kolonne føres fiskens gjennomsnittlige vekt (kg) per 31.12.2006. Husk å skille mellom klekket yngel og villfanget fisk.

NB! Kontroller følgende: beholdning per 1.1. + utsatt – uttak – svinn = beholdning per 31.12

Tabell 4. Utnyttet kapasitet per 31.12.

Her skal det opplyses om hvor stort volum som er benyttet per 31.12. spesifisert på anleggstype.

Tabell 5. Arbeidsinnsats

Oppgi hvor mange personer og antall arbeidstimer som er benyttet i selskapet i 2006. Personer og arbeidstimer skal fordeles på kjønn. Egen arbeidsinnsats medregnes.

Tabell 6. Kjøp og salg av varige driftsmidler

Kjøp: Her skal både nye og brukte varige driftsmidler som er innkjøpt i perioden tas med. Med varige driftsmidler mener en alle driftsmidler som har en levetid på 1 år eller mer, både aktiverte og direkte utgiftsførte.

Salg: Ved salg av varige driftsmidler oppgis oppnådd salgspris.

Tabell 7. Tap/Svinn

Her skal tap/svinn i tabell 3 fordeles på 5 ulike hovedårsaker. Disse er:

Død fisk:	Antall døde fisk som er tatt opp av merdene.
Utkast fra slakteri:	Antall fisk oppgitt fra slakteri som utkast.
Rømming:	Antall fisk som har rømt fra merdene.
Annet:	Antall fisk som er tapt som følge av predatorer, tyveri og andre uforklarlige årsaker.
Tellefeil:	Justering av antall fisk i henhold til opprinnelig utsett. Eks. Dersom sortering/utslakting viser et høyere antall fisk enn opprinnelig registrert ved utsett, skal differansen føres inn som et positivt tall. Motsatt ved et lavere antall fisk, da skal differansen føres som et negativt tall.

Merknader og kommentarer:

Dersom selskapet per 31.12. har fisk innfrosset i fryseri, noteres dette her.

NB! Alle beløp skal være eksklusiv merverdiavgift.

STATISTIKK FOR AKVAKULTUR 2006

RETTLEDNING TIL UTFYLLING AV SKJEMA FOR

ANDRE ARTER ENN LAKS OG ØRRET

KLEKKERI-/SETTEFISKTILLATELSE

Forhåndsutfylt opplysninger.

Selskapets navn, organisasjonsnummer og tillatelsesnummer mv. er forhåndsutfylt. Dersom noen opplysninger skulle være feil eller mangle, ber vi om at korrigeres.

Drifts- og selskapsopplysninger.

Angi øverst på skjemaet om det har vært drift i selskapet i 2005 og/eller i 2006. *NB! Har selskapet flere tillateler må vi ha opplysninger om hvor mange av tillatelsene som ikke var i drift i 2006.*

Tabell 1. Kjøp og interne mottak av rogn i 2006.

Under kjøp fører en innkjøp av rogn i løpet av 2006 målt i liter og beløp i kroner. Leveranser av rogn fra egen stamfisk, som ikke blir bokført som *kjøp i eget regnskapet* for settefisktillatelsen, skal også føres opp med mengde og *reelt* beløp i kroner i tabellen.

Tabell 2. Kjøp av yngel i 2006.

Her føres antall (stykke) yngel innkjøpt i perioden. Beløpet oppgis i kroner, eksklusiv merverdiavgift.

Tabell 3. Salg og interne leveranser av yngel i 2006.

Her ønsker en oppgitt antall yngel solgt i perioden. Vær nøyne med å skille mellom salg av yngel til matfiskproduksjon og til andre settefiskprodusenter. Interne leveranser oppgis i mengde og *reelt* beløp i kroner, selv om leveransen ikke er bokført som *salg i selskapets eget regnskap*. Summen av salg og interne leveranser er totalt uttak.

NB! Dersom selskapet også har tillatelse(r) for matfiskproduksjon (kombinerte drift) skal interne leveranser i dette skjemaet være lik interne mottak i skjemaet for tillatelsen(e) for matfiskproduksjon.

Tabell 4. Anleggstype.

Kryss av for benyttet type. Dersom en ikke bruker noen av de noterte anleggtyper kryss av for andre typer.

Tabell 5. Arbeidsinnsats.

Oppgi hvor mange personer og arbeidstimer som er benyttet i klekkeri-/settefisktillatelsen(e) i 2006. Personer og arbeidstimer skal fordeles på kjønn. Egen arbeidsinnsats medregnes.

Tabell 6. Kjøp og salg av varige driftsmidler i 2006.

Kjøp: Her skal både nye og brukte varige driftsmidler som er innkjøpt i perioden tas med. Med varige driftsmidler mener en alle driftsmidler som har en levetid på 1 år eller mer, både aktiverte og direkte utgiftsført.

Salg: Ved salg av varige driftsmidler oppgir De oppnådd salgspris.

NB! Alle beløp skal være eksklusiv merverdiavgift.

STATISTIKK FOR AKVAKULTUR 2006

RETTLEDNING TIL UTFYLLING AV SKJEMA FOR

SKJELL- OG SKALLDYRTILLATELSE

Forhåndsutfylte opplysninger

Selskapets navn, organisasjonsnummer og tillatelsesnummer mv. er forhåndsutfyldt. Dersom noen opplysninger skulle være feil eller mangle, ber vi om at dette korrigeres.

Drifts- og selskapsopplysninger

Angi øverst på skjemaet om det har vært drift i selskapet i 2005 og 2006, samt hvor mange år selskapet har vært i sammenhengende drift. For at et *selskap* skal kunne sies å ha vært i drift må det ha befunnet seg skjell (biologisk materiale) på en av lokalitetene i gjeldende år.

Har selskapet flere *tillateler* må vi ha opplysninger om hvor mange av *tillatelsene* som eventuelt ikke var i drift i 2006. En *tillatelse* regnes kun som i drift dersom det har befunnet seg skjell (biologisk materiale) på *tillatelsen* i gjeldene år.

Tabell 1. Salg av skjell og skalldyr

I tabell 1 skal salg av skjell og skalldyr for konsum føres opp. Opplysningene skal oppgis i *kilo* og *kroner*. *Her skal bruttotall i kilo oppgis for opptak fra sjø og pris per kilo før videreforedling*.

Tabell 2. Salg av yngel

I tabell 2 skal vi ha opplysninger om salg av yngel fra klekkeri for videre påvekst. Opplysningene her gjelder for yngel klekket i 2005 og 2006.

Tabell 3. Anleggstype/driftsform

Fire anleggstyper er spesifisert og vi ber om at det blir krysset av for den anleggstype/driftsform selskapet har. Benytter selskapet en annen anleggstype enn oppgitt, ber vi om at dette blir notert under merknader og kommentarer. Dette gjelder spesielt for klekkeriene.

Tabell 4. Forventet høsting av skjell

I tabell 4 skal forventet høsting av skjell for årene 2007 og 2008 oppgis i *kilo*.

Tabell 5. Arbeidsinnsats

Oppgi hvor mange personer og arbeidstimer som selskapet har benyttet i 2006. Personer og arbeidstimer skal fordeles på kjønn. Egen arbeidsinnsats medregnes.

Tabell 6. Kjøp og salg av varige driftsmidler

Kjøp: Her skal både nye og brukte varige driftsmidler som er innkjøpt i perioden tas med. Med varige driftsmidler mener en alle driftsmidler som har en levetid på 1 år eller mer, både aktiverte og direkte utgiftsført.

Salg: Ved salg av varige driftsmidler fører en opp oppnådd salgspris.

NB! Alle beløp skal være eksklusiv merverdiavgift.
