

Fishery Statistics 2007

This series consists mainly of primary statistics, statistics from statistical accounting systems and results of special censuses and surveys, for reference and documentation purposes. Presentation is basically in the form of tables, figures and necessary information about data, collection and processing methods, and concepts and definitions. In addition, a short overview of the main results is given. The series also includes Statistical Yearbook of Norway.

Preface

This publication presents a statistical survey of the fishing industry and comprises a sample of accessible statistics. From the sea fisheries the publication presents statistics of fishermen, fishing vessels, catches and economic results. This edition also contains landings in Norway from foreign vessels. It also includes statistics of fish processing industry, external trade of fish and an overview of the state of some important fish stocks.

The Directorate of Fisheries issued the publication until 1977. The 1977 issue was the first one published by Statistics Norway. The Directorate of Fisheries still produces a considerable part of the database for the tables presented in the publication, as well as contributing to the text of chapter 1, 2, 4 and 6.

The 2005-edition was thoroughly examined and some considerable changes and simplifications were made. In return, more details are now published on the Internet.

A Norwegian edition for 2007 was published in August 2009.

Preliminary figures for fisheries 2008 were presented on Statistics Norway's web pages February 2009.

The entire publication is presented on the web in PDF format, but the tables can be downloaded in Excel format. The Internet-address is:
<http://www.ssb.no/english/subjects/10.05/>

For more information the Directorate of Fisheries has web pages on the Internet.
The Internet-address is: <http://www.fiskeridir.no>

The publication has been prepared under the supervision of Executive Officer Berit Storbråten. Ole O. Moss, Head of Division for Primary Industry Statistics, is responsible for this publication.

6.1. National account figures for fisheries. 2000-2007*. NOK million	54
6.2. Average operating results of whole-year operated fishing vessels 8 metres and above, by length of vessel, county and type of fishery. 2007. NOK.....	54

1. Background and purpose

1.1. Purpose and history

The Fishery statistics presents an overview of fishermen, fishing vessels, fish stocks, catches, employment and the economy. The fishery statistics were first displayed in a publication of its own in 1868. The Directorate of Fisheries took over the preparation of the publication in 1900. As from 1977, Statistics Norway has been the responsible publisher in co-operation with the Directorate of Fisheries. Up to the 2004-edition, the directorate still produced a considerable part of the tables. As of 2005, Statistics Norway receives the catch data on a detailed level and produces the tables itself. This gives Statistics Norway more alternatives in what to publish, and it also makes it easier to answer various requests from the public. The paper edition includes fewer tables compared with earlier editions; on the other hand one can now find figures on a more detailed level on the Internet.

Fishermen and fishing vessels

Chapter 2 presents an overview of fishermen and fishing vessels engaged in professional fishery, sealing and whaling. The statistics are based upon administrative data sources founded by legislation and regulations.

Fishermen

Participation in income-producing fishery, sealing and whaling is regulated by the law of January 2000 (law of participation). The law is used to adapt the catching capacity to the variable resources, by regulation of participation. Further details are given in chapter 4.2.

The Directorate of Fisheries collected yearly, before 1982, information about the number of fishermen from the municipal fishery committees. This information was mainly based upon the municipal register of fishermen. The registration rules were changed in 1982.

As from 1 January 1981 the responsibility for the Register of Fishermen was transferred from the National Insurance Institution to the Directorate of Fisheries. The local fishery committees deal with the content in application forms. The approved application forms are sent to the Directorate of Fisheries for registration on electronic data processing.

Vessels

The law of December 1917 states that all vessels engaged in fishery must be registered in the Register of Norwegian Fishing Vessels. The law of March 1999 § 4 also states that a vessel can not be used in income-producing fishing or catching without a permit from the authorities.

All licences, except for sealing and whaling, are assigned to one particular person or company and for one particular vessel. In other words, a licence does not automatically follow the vessel with change of ownership. Licences for sealing and whaling are assigned only to persons and not vessels. All licences are rights given by the Ministry of Fisheries and Coastal Affairs on application.

A new set of rules came into force in 2006 with the law of October 2006. The law regulates fishing with trawl, shrimp trawl, purse seine and purse seine and saithe. This regulation replaces several other regulations.

The Directorate of Fisheries publishes the Register of Norwegian Fishing Vessels each year on the Internet: www.fiskeridir.no/fiskeridir/english

The Directorate of Fisheries also publishes a booklet cover called "Norwegian fishing vessels, fishermen and licences". This can be found on the Internet: www.fiskeridir.no/fiskeridir/english/statistics/booklets/fishery_booklets.

In some fisheries participation is conditioned by licence from the authorities. The Directorate of Fisheries records such licences.

Statistics Norway carried out fishery censuses in 1948, 1960 and 1971. The figures from these censuses represent the most reliable information about fishermen and fishing vessels for the census years. No new fishery census is planned.

Stocks Chapter 3 presents an overview of the development in some of the fish stocks in the Norwegian maritime zone. The figures are prepared by the Institute of Marine Research (IMR), which publishes the report "Havets ressurser og miljø" each year. The IMR has published this report since the early seventies.

Catches The legal acts relating to seawater fisheries, and to the marketing of raw fish, are the basis for collecting landing- and contract notes, which the catch statistic is based on.

The catch statistics of chapter 4 cover all catches of marine fish delivered in Norway or abroad by Norwegian fishermen. Catches of marine fish delivered by Norwegian vessels which have bought quotas from other countries are included. Catches for the purpose of research are also included.

Figures from foreign vessels delivering catches in Norway can be found in separate tables. The statistical committee of UN decided in 1954 that the responsibility for the collection of information from landings and the production of the corresponding catch statistics should be linked to the flag state of the vessel.

According to a law of 17th June 1966 there was a general prohibition on vessels from foreigner countries to bring their catches to Norwegian harbours. Exemptions were, upon application, given by the Ministry of Fishery. In 1993 the law was amended, and foreign vessels were allowed to deliver their catches to Norwegian harbours.

Chapter 4 also comprises sealing, whaling and the fisheries in other countries.

Norway established an economic zone of 200 nautical miles from first of January 1977, and a fishery protection zone of 200 nautical miles around Svalbard from 15. June 1977. From 23th May 1980 Norway established an economic zone around Jan Mayen. There is a general prohibition on foreign fishermen to fish in the Norwegian economic zones. Norway and Russia has since 1978 each year negotiated an agreement that regulates the fisheries in the Barents Sea between the two states (Gråsoneavtalen).

Norway has entered the following fishery agreements with other countries:

- Long-term agreements on reciprocal fishing rights with EU, Russia, Greenland and the Faroe Islands.
- Phasing-out agreements providing for transitional fishing rights to Poland.
- For the Skagerrak and the northern part of the Kattegat there is a special tripartite agreement between Denmark, Sweden and Norway.
- EU, Russia, Iceland, the Faroe Islands and Norway are allowed to fish Norwegian spring-spawning herring in Norwegian waters.
- Greenland, Iceland and Norway can fish capelin in each other's zones.

Norway is a member of NEAFC (The North East Atlantic Fisheries Commission) and NAFO (Northwest Atlantic Fisheries Organization), which administer the fisheries in the North East- and North West Atlantic.

Each year The Advisory Committee on Fishery Management (ACFM) gives recommendations for total allowable catch (TAC) of the different fish species, which are the basis for Norway's agreements with other countries.

Processing and external trade

Chapter 5 comprises establishments, employment and some economic relations in the fish processing industry. It also comprises export and import of fish and fish products. Please note that the tables comprise all processing and trade of fish and fish products, irrespective whether the fish originates from fisheries or fish farming.

The figures of establishments, employment and the fish processing industry are prepared by Statistics Norway, Division for Energy and Industry Production Statistics. The manufacturing statistics offer a detailed overview on employment and value added by industry and region. The manufacturing statistics were published for the first time in 1876 for the reference years 1870-1874.

The figures of export and import are prepared by Statistics Norway, Division for External Trade. The purpose of the external trade statistics is to give information about the commodity flows between Norway and other countries. The monthly statistics on external trade in goods have been published since 1913.

Profitability

Chapter 6 deals with national accounts figures of the fishing industry and operating profit of the fishing fleet.

The national accounts figures are prepared by Statistics Norway, Division for National Accounts. The statistics are designed to provide a consistent and comprehensive survey of the overall national economy. The first national accounts for Norway based on modern principles were published by Statistics Norway in 1952. In the 1950s, national accounts figures were compiled back to 1865.

The figures of operating profit for whole year operating vessels come from the Directorate of Fisheries' Profitability Survey of the Fishing Fleet. The survey is based on the accounts of a sample of owners of such vessels. Statistics Norway has carried out the sample and method of estimation. As of 2004, the survey has been done entirely by the Directorate of Fisheries, and is a continuance of the survey published by the Budget Commission of Fishery since 1966.

1.2. Users and applications

The purpose of collecting data from catches is to gather information necessary to secure a viable administration of the marine resources. This is done by controlling resources and quotas, and by having fishery statistics of good quality.

The data forms the basis for research work in connection with regulations, strategic analysis, analysis of structure of the fishing fleet, and also the consequences of administrative actions on the industrial economy. The data also forms the basis of fulfilling Norway's obligation to report to international organisations.

Estimates on the stocks and catch statistics are used to make agreements between countries when deciding on quotas and catch regulations, while scientists use statistics in their assessments of the stocks.

Figures from the fishery statistics are feeded into the national accounts, which are an essential information source for the analysis of the economic development and economic structure in Norway.

The Directorate of Fisheries has in connection with the Profitability Survey, set up a reference group. The reference group shall ensure that the users need for relevant information of high quality is available. The reference group has consultative authority when it comes to presentations, contents and the use of methodology in the survey.

The fishery statistics is otherwise used by public authorities and the general public, research institutions, students, media, financial analysts, interest groups and national and international organisations.

2. Fishermen and fishing vessels

2.1. Main results

Constantly fewer fishermen are participating in the fisheries, a trend that has been lasting for a while. Since 2000 it is those with fishing as a secondary occupation which has declined relatively the most.

In 2007, 13 242 persons were registered in the Register of Norwegian Fishermen. In 1992, there were more than twice as many in this occupation. Compared with 2006, 5 per cent fewer fishermen were registered in 2007. Close to 80 per cent were registered with fishing as main occupation, and Nordland and Møre og Romsdal counties had most fishermen.

The number of fishing vessels is also declining. The large reduction in the last years has several causes. The Directorate of Fisheries has carried out an extensive quality control of the Register of Norwegian Fishing Vessels. In 2004, a yearly fee for all vessels in the register was induced. In 2003, a condemnation system for smaller vessels with licence to fish on the coast were introduced. A structural rearrangement among larger vessels fishing on the coast and in the deep-sea fleet is another cause.

In 2007, a total of 7 039 vessels were listed in the Register of Norwegian Fishing Vessels. This was 3.6 per cent less than the previous year. 61 new vessels were built in 2007. More than half of the vessels, 4 054 in total, were smaller than 10 meter. Nordland county had most vessels, 1 792 in total, while Møre og Romsdal was the county with most vessels above 28 meter. There were 617 licences in total, distributed to 333 vessels in the Register of Norwegian Fishing Vessels. Hordaland was the county with most licences.

2.2. Statistics production

Population

The statistics comprises all fishermen registered in the Register of Norwegian Fishermen. The register ensures that every fisherman engaged in sea fisheries, whaling and sealing in Norway is registered. Fishermen are divided into those with fishery as main occupation (section B) and those where fishery is secondary occupation (section A).

The statistics comprise all vessels registered in the Register of Norwegian Fishing Vessels.

Data sources

Sources are the Register of Norwegian Fishermen, Register of Norwegian Fishing Vessels and the Register of Norwegian Fishing Licences. The Directorate of Fisheries is responsible for all the registers.

The Directorate of Fisheries' regional offices deal with the content in application forms. The approved application forms are sent to the Directorate of Fisheries for registration on electronic data processing.

The Directorate of Fisheries registers all vessels that are used in commercial fishing in the Registers of Norwegian Fishing Vessels. The vessel owner is obliged to report the vessel to the register and report removal by sale, condemnation and withdrawing from fishing activities.

Collection of data

The registers are continuously updated, and Statistics Norway receives data as per 31st December each year from the Directorate of Fisheries. The Register of Norwegian Fishermen and Register of Norwegian Fishing Vessels are also available on the Directorate of Fisheries' website.

Control and revision Control and revision of the data are carried out by the Directorate of Fisheries. As from 1st March 2003, the local representatives of the Directorate of Fisheries have taken over the responsibility of maintaining the information in the Register of Norwegian Fishing Vessels and the Register of Norwegian Fishing Licences.

2.3. Concepts, variables and classifications

Definitions *Fishermen* comprise all fishermen engaged in sea fisheries, whaling and sealing. Even crews on fishing vessels not directly taking part in fishing are included.

Main occupation. Persons listed in section B must have, among others, minimum 20 weeks of work in the fisheries or have an income from fisheries of at least the national insurance's basic amount.

Secondary occupation. Persons listed in section a must, among others, work in the fisheries and have a minimum income of half the national insurance's basic amount.

Vessels are classified by their largest length.

2.4. Sources of error and uncertainty

Measurement and processing errors Information from the Register of Norwegian Fishermen and the Register of Norwegian Fishing Vessels are counted 31st December each year. Information about vessels with licences is taken by combining the Register of Norwegian Fishing Vessels and the Register of Norwegian Fishing Licences.

Delegating the operations of the Register of Norwegian Fishing Vessels and the Register of Norwegian Fishing Licences to local representatives of the Directorate of Fisheries has reduced the lag in registering new information.

2.5. Comparability and coherence

Comparability over time and space The selection of tables for this edition has changed compared with earlier years, but the data sources are the same.

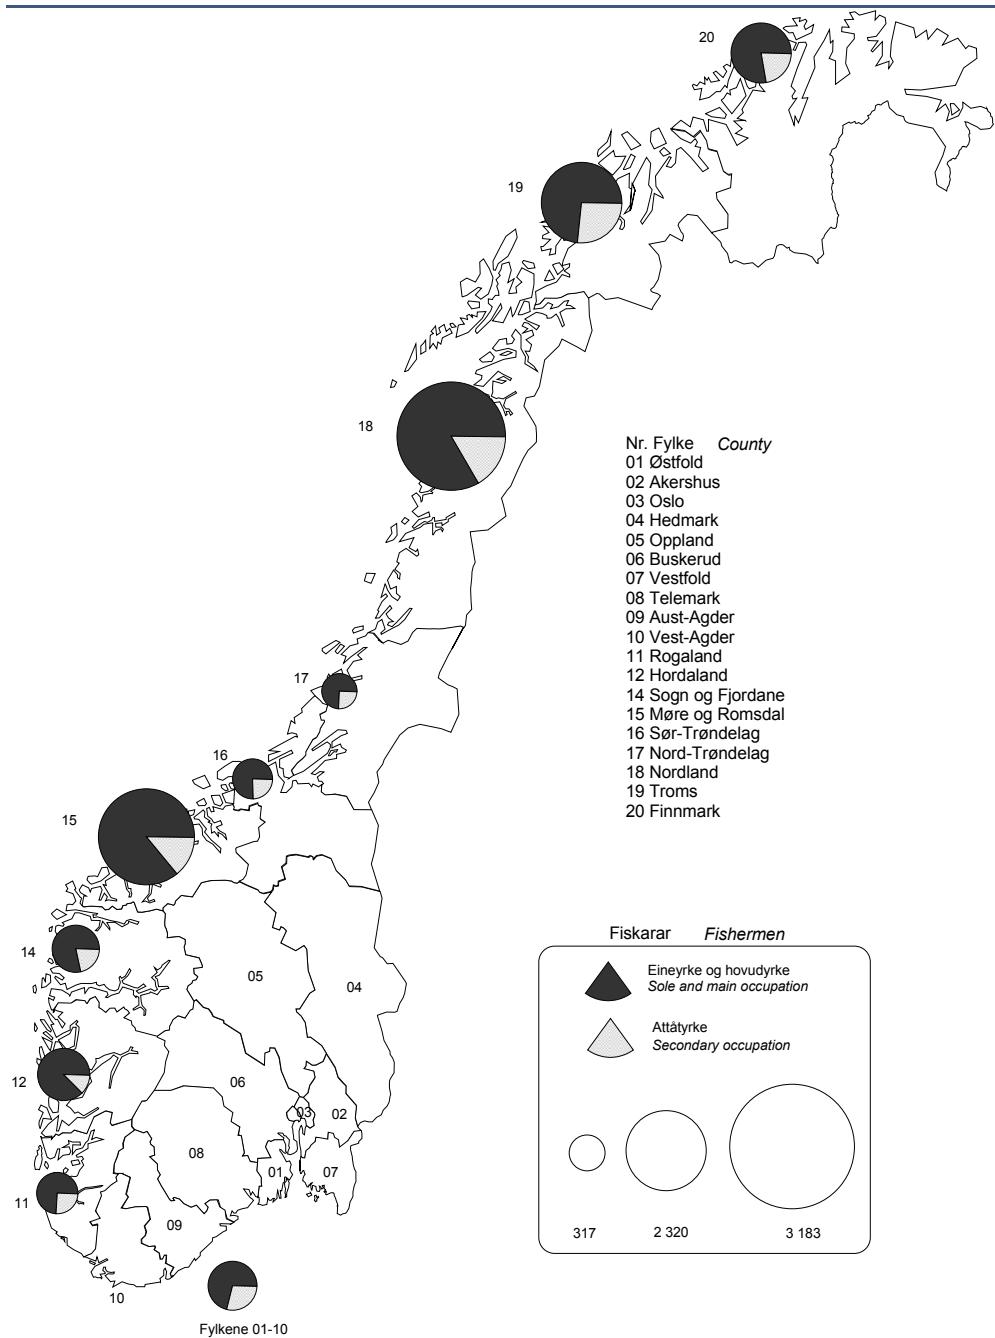

Figures on fishermen and vessels have also been published in NOS Historical Statistics 1978 and 1994, with time series going back to 1870.

Coherence with other statistics The Directorate of Fisheries was responsible for publishing fishery statistics up to 1977. As from 1977, Statistics Norway has published this statistic under the name NOS Fishery Statistics.

Each year the Directorate of Fisheries publishes figures on fishermen, vessels and licences on their website:
www.fiskeridir.no/fiskeridir/english/statistics/norwegian_fisheries

The division for statistics in the Directorate of Fisheries also presents an overview of the development in the number of fishermen, vessels and licences in the publication "Norwegian fishing vessels, fishermen and licences".

3. Stocks

3.1. Main results

The Norwegian fish stocks are divided in three important areas; the Barents Sea, the Norwegian Sea and the North Sea/Skagerrak. The stocks in the Barents Sea are in good conditions, except for capelin and redfish, and unregistered cod-fishing is a big problem. In the Norwegian Sea all the pelagic stocks are in good conditions, while many stocks in the North Sea/Skagerrak have a poor recruitment.

The development of the stock of northeast arctic *cod* is shown in figure 3.1. The total stock increased to 2.4 million tonnes in 1993, after the eighties which were characterized by a heavy exploitation of the stock. Up to 1999 the stock declined again, but has recovered in recent years.

The 2007 stock estimate was 1.8 million tonnes. The estimate of the spawning stock this year was 600 000 tonnes. Earlier sexual maturity has been an important reason for the rise in spawning stock biomass. The limit biomass for spawning stock (B lim) is 220 000 tonnes, while the precautionary biomass for spawning stock (B pa) is 460 000 tonnes. The stock is assessed to have a good reproduction capacity, but there is a risk for too high exploitation.

The total stock of northeast arctic *haddock* increased from a little over 60 000 tonnes in 1984 to 326 000 tonnes in 1986 (figure 3.2). After 1986 the stock size decreased for some years, but had a substantial growth up to 1994 (about 550 000 tonnes). The estimate of the total stock in 2007 was 630 000 tonnes with a spawning stock of 277 000 tonnes. The stock of haddock is considered to be in good condition.

The spawning stock of northeast arctic *saithe* in 2007 was 834 000 tonnes (figure 3.3). The limit biomass for spawning stock (B lim) is 136 000 tonnes, while the precautionary biomass for spawning stock (B pa) is 220 000 tonnes. The stock is considered to be in good condition.

The development of the stock of Norwegian spring-spawning *herring* is shown in figure 3.4. The variation is caused by a combination of over-exploitation and natural causes. In 1987 the majority of the numerous 1983-year class reached maturity, and the spawning stock increased from about 900 000 tonnes in 1987 to 2.7 million tonnes in 1988. The spawning stock in 2007 was estimated to be 11.6 million tonnes. The stock is in a positive trend with recruitment expected to increase in the coming years due to the strong 2002-year class. The limit biomass for spawning stock (B lim) is 2.5 million tonnes, while the precautionary biomass for spawning stock (B pa) is 5 million tonnes.

The capelin stock in the Barents Sea has varied a lot since the mid eighties. This variation is partly explained by over fishing, but also by natural causes. The stock size of one year old and older capelin by autumn 2007 was estimated to almost 2 million tonnes (figure 3.5). The estimate of the spawning stock was 189 000 tonnes, while the limit biomass for spawning stock (B lim) is 200 000 tonnes. The stock size is still considered to be to low, although the stock was more than doubled since 2006. This is not assessed to be caused by fishing, but from predation pressure from large year classes of herring in the southern Barents Sea.

The spawning stock of *blue whiting* had its peak in 2003, but has since then declined (figure 3.6). This was mainly because of overfishing, and quotas were introduced in 2005. The estimate of the spawning stock in 2007 was 4.9 million tonnes. The limit biomass for spawning stock (B lim) is 1.5 million tonnes, while the precautionary biomass for spawning stock (B pa) is 2.25 million tonnes. The stock is assessed to be in good condition, but the exploitation is too high, which gradually will affect the spawning stock.

3.2. Statistics production

Population

The statistic includes a selection of important stocks in the Norwegian maritime zone. These species are northeast arctic cod, northeast arctic haddock, northeast arctic saithe, Norwegian spring-spawning herring, capelin and blue whiting. Total stock and spawning stock, as well as limit biomass for spawning stock and precautionary biomass for spawning stock are mentioned.

Data sources

The data comes from the Institute of Marine Research (IMR) and the International Council for the Exploration of the Sea (ICES). ICES draws up several reports with an overview of the development of each fish stock. The Institute of Marine Research publishes annually a report "Marine resources and environment", with information on the most important fish stocks.

Estimation

Measurements from cruises, catch statistics and biological samplings from catches form the basis for stock estimations of northeast arctic *cod*, *haddock* and *saithe*. These figures are used by both ICES and IMR in their calculations when determining quotas.

IMR carries out annual cruises where the Norwegian spring-spawning *herring* spend the winter. Measurements are made using trawl haul and echo sounder.

The total stock of *capelin* is measured acoustic each autumn. The cruise covers the Barents Sea and adjacent areas. The stock estimation from the cruises is used as direct measure of stock size, and prognosis and advices on quotas are made based on models.

Calculations of blue whiting are based on many cruises, which use acoustic methods.

3.3. Concepts, variables and classifications

Definitions

B lim is the limit biomass for a spawning stock. If the spawning stock is below this level, there is a higher risk that the stock reaches a level where it suffers from severely reduced productivity.

B pa is the precautionary biomass for a spawning stock. This level is set to avoid the risk of the spawning stock to decrease to or below the *B lim* because of uncertainties in the assessment.

3.4. Sources of error and uncertainty

Measurement and processing errors

The models used in stock estimations are advanced and take into consideration mortality rate, growth, sexual maturity, predation and temperature. This can sometimes make the outcome and interpretations difficult.

There are some problems with estimating several of the important fish stocks because of varying quality of catch statistics. This is mainly because of discard and unregistered fishing.

3.5. Comparability and coherence

Comparability over time and space

Figures on stock sizes were first published in NOS Fishery Statistics 1983. The selection of tables for this edition has changed compared with earlier years, but the data sources are the same. This edition is extended with text and figure on the blue whiting stock.

Coherence with other statistics

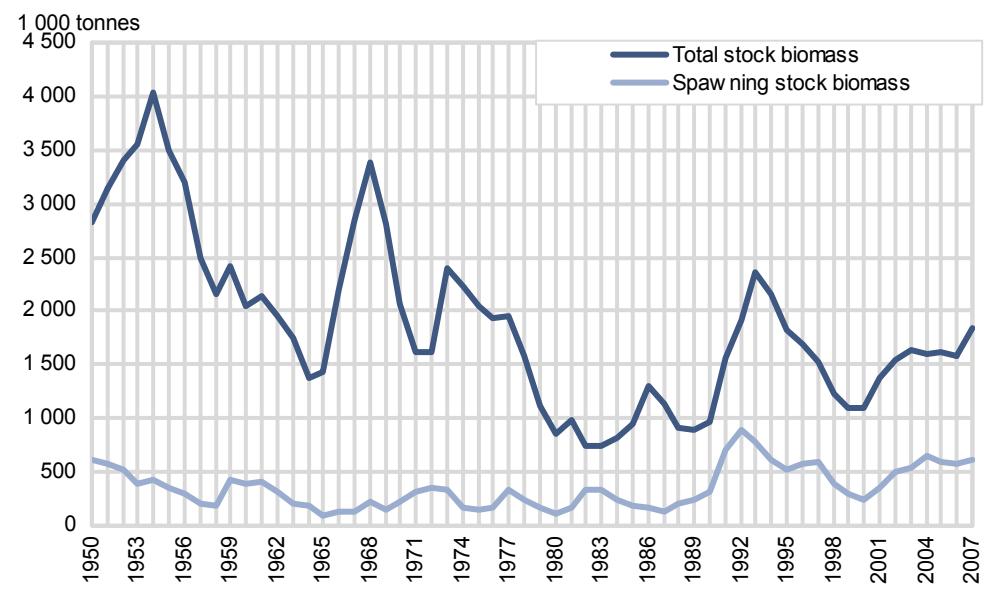

The working groups of ICES publish different reports on their website, describing conditions of stocks and advices on how to manage the stocks. These reports cover about 135 different stocks:

<http://www.ices.dk/committe/acfm/comwork/report/asp/advice>

Institute of Marine Research publishes “Marine resources and environment”, a survey report on Norwegian maritime zones:
http://www.imr.no/produkter/publikasjoner/havets_ressurser

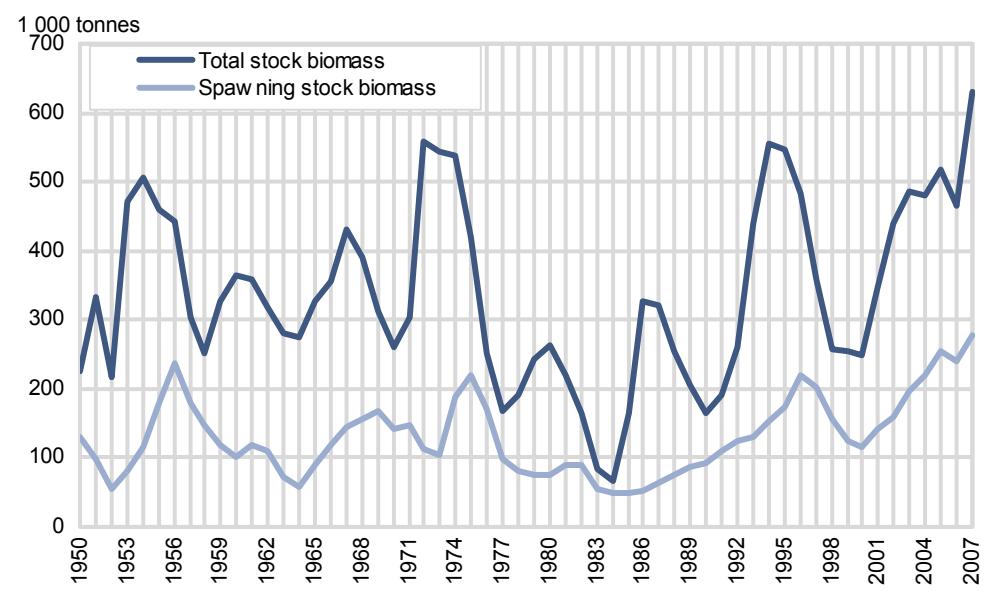

Statistics Norway also refers to fish stocks in the publication “National Resources and the Environment”: http://www.ssb.no/emner/01/sa_nrm/

4. The catch

4.1. Main results

Almost 2.4 million tonnes of fish, shellfish and molluscs were caught in 2007. This is almost 6 per cent less than in 2006. The total value of the catch was NOK 12 billion, a small increase from previous year. Pelagic fish dominated in quantity, and cod fish had the highest value. Cod however, was the most valued species at NOK 3.7 billion, while herring was worth NOK 2.2 billion.

The catch in quantity has dropped in the last years, but except for 2003 the value has not. This means that the average prices have risen in the same period. A closer look at the average price for some of the species shows better prices for important species such as cod, haddock, saithe, blue whiting and deep water prawn. The average price of herring and mackerel have also increased, but dropped from 2005 till 2007.

Seventy per cent of the total quantity of the catch was used for consumption, while the rest went to production of meal and oil. For consumption, herring is the most important fish measured by quantity, while cod is the most important fish when it comes to value. Blue whiting is the most important trash fish. Most of the catch is taken with trawl and seine.

In quantity, the catch was largest in the northern fishing grounds (the Norwegian Sea, the Barents Sea and Svalbard). The value of the catch is also dominated by the northern fishing grounds, both at sea and along the coast. The counties with the largest landings were Møre og Romsdal and Rogaland, while Møre og Romsdal and Nordland were the counties with the highest value of landings. The largest sales co-operatives were Norges Sildesalgsdag in quantity, and Norges Råfisklag referring to catch value. The catch of seals was reduced to 13 980 in 2007, which is 3 057 fewer than in 2006. The number of whales caught was 545, which is 57 more animals than previous year.

In 2007, foreign vessels landed 284 000 tonnes of fish and other species in Norway. This is 69 000 tonnes more than the previous year. The rise is mainly caused by larger deliveries of all species, except flatfish. The total value was close to NOK 2.1 billion. Russian vessels delivered 128 000 tonnes, mainly codfishes. The Faroe Islands delivered 66 530 tonnes, almost solely pelagic fish.

The world catch of fish is not changing much from one year to the next. Total production in 2006 was approximately 92 million tonnes, down one million from 2005. China is dominating with 17 million tonnes, while Norway is in 11th place with 2.3 millions. About ¾ of the world catch is used for human consumption.

4.2. Statistics production

Population

The statistic cover all catches of marine fish delivered in Norway or abroad by Norwegian-registered vessels and catches of marine fish delivered in Norway by foreign vessels. Included are also sealing, whaling, catches of seaweed, oysters and mussels, while delivering outside the sales co-operatives and none-registered sales are not included. Fish farming and fishing for own use is not included either.

Data sources, collection of data, control and revision

The Directorate of Fisheries produces catch statistics based on information from approved sales co-operatives. According to law, officially approved sales co-operatives have the sole right of first hand sale of most fish species and other animals caught in the sea. Excepted from this are salmon, sea trout and seal. The sole right also applies to all sales of fish which comes directly from the sea and are sold in Norway by foreign vessels.

When landed the catch is weighted before sold. A legal document called contract note (bill) is filled in showing quantities and values of the landed fish species, type of fishing gear, disposition of the catch, fishing ground, landing place and the register identification of the vessel. The sales co-operatives submit this information electronically to the Directorate of Fisheries for producing statistics. In addition, information is obtained from the yearly enquiry of the salmon and sea trout fisheries done by Statistics Norway and information from a few other sources. The information from the sales co-operatives also comprises Norwegian catches landed abroad.

In addition, the sales co-operatives deliver information about landings of foreign vessels. These catches are presented in separate tables.

Catch journals

In some fisheries the vessel owners are obliged to keep catch journals. This concerns e.g. trawling of codfish and shrimps, and catch of small whales. From these journals the Directorate of Fisheries produces statistics.

The Directorate of Fisheries does an extensive control and revision of the data. When the control and revision is finished, the Directorate of Fisheries considers the data ready to produce final statistics. Statistics Norway receives this data as a direct output from the database of contract notes as per first of October the year following year of the catch. Statistics Norway controls that all the data is received before producing the tables. Although the data is regarded as final for statistical purposes, the database of contract notes in the Directorate of Fisheries is constantly updated whenever needed. These late updates are non-significant and do not affect the quality of the statistics.

Yearbook of Fishery Statistics

This publication from FAO (Food and Agriculture Organisation of the United Nations) gives main figures of the fisheries in all countries. The catch figures in the publication also comprise fishery for own consumption, as well as fresh water fisheries and fish farming. The Internet address is www.fao.org.

Estimation

Before the data is sent to Statistics Norway, the Directorate of Fisheries converts all the different types of landed catch to live weight.

4.3. Concepts, variables and classifications

Definitions

As from 1977 the quantities are given in *live weight*. Live weight is the weight of the fish in the condition it is caught. The weight of fish that is landed without head, in gutted condition, as fillet or salted etc. is converted into live weight. Annex B shows the conversion factors.

FAO uses the concept of *nominal* catch instead of live weight. The word *catch* is also often used without further explanation. In catch journals this is interpreted as estimated quantity in live weight. For further details see FAO Yearbook of Fishery Statistics (Catch concepts: Diagrammatic presentation).

Catch value is the amount paid to the fishermen for the catch. This includes freight and price subsidies and production tax, but not tax to the sales co-operatives. Value added tax is not included.

Pelagic means living in the water masses.

Clarifications and concept on quotas

Each year The Advisory Committee on Fishery Management (ACFM) gives recommendations for *total allowable catch* (TAC) of different fish species. Consultations between Norway and other countries are based upon these recommendations.

Norway and Russia are acting jointly to set *national quotas* for stocks of northeast arctic cod, northeast arctic haddock and capelin. Quotas given to a third country are taken into consideration before Norway and Russia set their own national quotas.

Norway and EU do not give quotas to a third country before consulting on mutual stocks. Quotas to a third country are a result of consultations between Norway and the third country based on Norway's quota. After all consultations a national quota is given.

National disposable quota is the quota Norwegian fishermen can use after all consultations and possible purchase and sales of quotas to other nations are final. This quota should be used when comparing quotas and catches for each country. For more information about agreements on quotas, see the yearly Reports to the Storting "Om de fiskeriavtalene Norge har gjort med andre land".

Standard classifications

Standard names and grouping of species caught (target species), classification of major fishing areas and conversion factors are listed in the annexes.

4.4. Sources of error and uncertainty

Measurement and processing errors

The statistic is based on a legal document called contract notes signed by both the fishermen and the buyers as a part of the settlement. The quality of the contract notes are checked by the sales co-operatives, before submitted to the Directorate of Fisheries. These notes contain information about quantity and value together with other information used in resource management and statistics. The information on the contract notes may vary in quality, and extensive verification is a necessity.

1977 was the first year the primary data was of such a quality that it could be used as basis for catch statistics in the publication NOS Fishery Statistics, and there is still some information lacking on the contract notes. Vessels using more than one type of fishing gear on one trip, can only report one type of fishing gear on the contract note, and vessels fishing in more than one fishing ground can only report one fishing ground. This must be considered when reading the tables. This is also the explanation for possible discrepancies between catch statistics based on contract notes and those based on catch journals from trawlers. Information from catch journals can sometimes be missing due to the loss of catch journals prior to submission.

Non-response errors

It is not possible to estimate figures for landings which have not been registered through official channels. This concerns for instance some sales of the edible crab.

There is also some non-response of catch journals due to different reasons like shipwreck, change of ownership and bankruptcy.

4.5. Comparability and coherence

Comparability over time and space

The selection of tables for this edition has been changed compared with earlier years, but the data sources are the same. As from 2005 a new grouping of target species is used, and the list of specified species is slightly changed as well as the categories for disposition of the catch.

Time series of catches in quantity and value all the way back to 1977 are published in the series NOS Fishery Statistics. Furthermore, comparable time series going back to 1866 are presented in NOS Historical Statistics 1978 and 1994, and in the Statbank. Up to 1974 the quantity is given in fresh weigh, as from 1975 quantity is given in live weight.

Statistics Norway publishes preliminary figures of catches in quantity and value for the whole year and for the first 6 months of a year in the 6th and 35th week respectively.

In the series NOS Fishery Statistics 1996 - 2004, landings from foreign vessels in Norway were dealt with in a separate chapter (chapter 4).

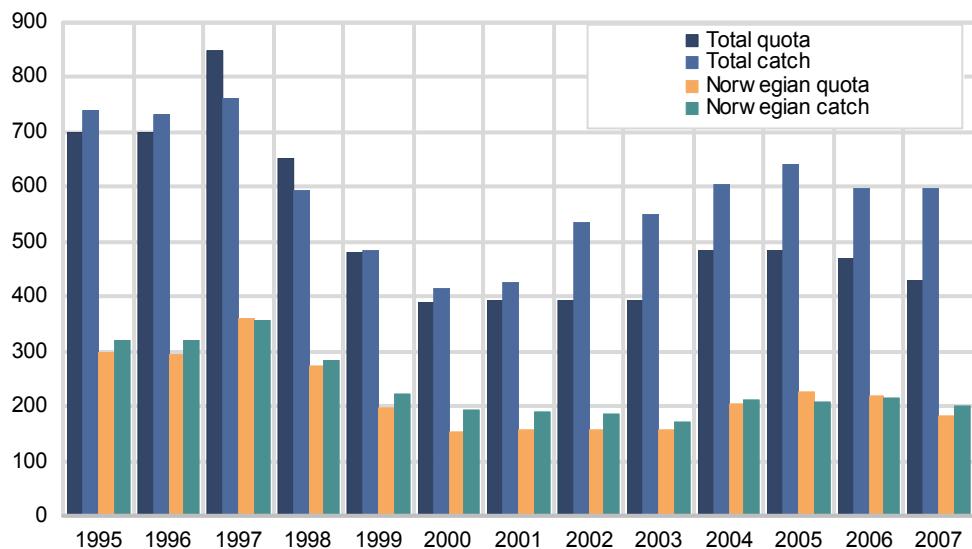

Coherence with other statistics

The Directorate of Fisheries publishes preliminary figures on Internet:
<http://www.fiskeridir.no/fiskeridir/english>

The Directorate also submits catch statistics to several international organisations such as FAO, Eurostat, ICES, NAFO and OECD.

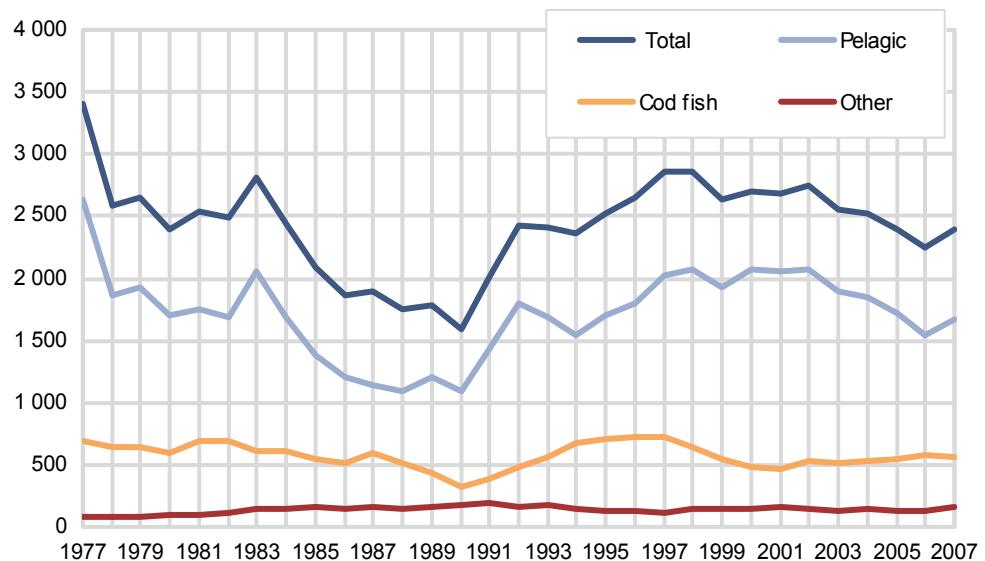

Many international organisations also publish statistics of catches in quantity and value, e.g. FAO: <http://www.fao.org>, and Eurostat: <http://ec.europa.eu/eurostat>

5. Processing and foreign trade

5.1. Main results

The number of establishments and employees in the fish processing industry are continuously in decline. There were 508 establishments in 2007, down almost 150 establishments since 2000. In total, 8 837 persons were employed in the industry in 2007, which is more than 3 500 fewer than in 2000. Nordland is the county with most establishments and employees.

The export of fish and fish products has the last couple of years increased in value, while the quantity of the export has been about the same. The export of fish from fisheries is still dominating both in quantity and value. However, the export of farmed fish is growing steadily, and represents the largest growth in value, as the salmon prices have been high.

The total export value of fish and fish products in 2007 was NOK 37.1 billion, up 3 per cent from the previous year. The export quantity was 2.2 billion tonnes, an increase of 7 per cent from the previous year. Approximately 60 per cent of the quantity was sold to EU, which in value accounted for close to 67 per cent. Countries with the largest import measured in quantity were France, Denmark, Russia and United Kingdom. Apart from farmed salmon, the highest value comes from *other fresh or chilled fish, included fillets*, which primarily was sold to EU countries. Norway imported 607 000 tonnes of fish at a value of NOK 6.5 billion in 2007.

5.2. Statistics production

Population

The statistics on establishments and employees cover all establishments in manufacturing, subgroup *15.2 Processing and preserving of fish and fish products*, as defined by the Norwegian Standard Industrial Classification.

The statistics on external trade of fish and fish products cover customs declared shipments, fish products from fish farming included. The list of commodity numbers is shown in appendix G.

Data sources

The manufacturing statistics are based on information from questionnaires and data from administrative registers. The standard financial report that the tax authorities collect from the enterprises (the Standard Industry Form) are an important source for enterprises with at least ten employees. The Standard Industry Form covers income statement and balance.

For the remaining establishments total figures are estimated based on annual accounts, employment and sales. All joint-stock companies are required to send their annual accounts to the Norwegian Register of Company Accounts in Brønnøysund. The annual accounts include the income statement as well as the balance sheet, but the specifications vary and are not as detailed as the Standard Industry Form.

The majority of entries to the Central Register of Establishments and Enterprises of Statistics Norway have been taken from the Central Coordinating Register for Legal Entities in Brønnøysund. The Central Coordinating Register for Legal Entities contains all enterprises in the Value Added Tax Register of the Directorate of Taxes and the Register of Employers of the National Insurance Administration.

The statistic on export and import of fish and fish products are based on administrative data from customs declarations collected by the customs authority under the Customs Act.

Collection of data, control and revision

Manufacturing statistic: The questionnaires are sent to the enterprises and optically read upon return. Standard industry forms that have not been received electronically are manually registered.

The data collected are edited at establishment level. Consistency controls are conducted between items on the form, against information for the previous year, against production statistics, against the Central Register of Establishments and Enterprises, against the standard industry form and against the annual reports.

External trade: The relevant data are transmitted electronically from the Directorate of Customs and Excise to Statistics Norway twice a week. The data go through automatic controls in the electronic customs' declaration system. The controls are partly determined by the customs and partly in cooperation with Statistic Norway. In the subsequent revision in Statistic Norway e.g. procedure codes and commodity numbers are examined by a system which intends to catch and correct the most serious errors in the data.

5.3. Concepts, variables and classifications

Definitions

An *establishment* is defined as a functional unit, which at a single physical location is engaged mainly in activities within a specific activity group. This definition corresponds to the definition in ISIC Rev. 3.

An *enterprise* is defined as an organisational unit comprising all economic activities engaged in by one and the same owner. Hence an enterprise is a legal entity covering one or more productive units (establishments).

Exports comprise goods declared for exports directly from free circulation and from customs' warehouses.

Imports comprise goods that are declared directly at the border crossing or via a customs' warehouse. Goods going directly from abroad to regular installations on the Norwegian Continental Shelf are not included, whereas goods via Norwegian customs district are included.

The Norwegian commodity classification for customs' and statistical purposes is based on the international customs and statistical nomenclature Harmonised System (HS).

Standard classifications

Norwegian Standard Industrial Classification, which is based on the industrial classifications approved by the EU (NACE Rev. 1.1) and the UN (ISIC Rev. 3).

The Harmonised System classifies goods mainly according to their type of physical material. In addition to the six-digit code of the HS, the Norwegian nomenclature has a national seventh digit for customs' purposes and an eight for statistical needs. The nomenclature is published annually in the series NOS (Official Statistics Norway) Commodity List.

The country nomenclature follows the international standard ISO-3166.

5.4. Sources of error and uncertainty

Measurement and processing errors

Manufacturing Statistics: Common errors occur during processing such as coding, data entry, data editing, imputation, etc. There are also errors in the register, during optical reading, different accounting and different interpretation of concepts.

External trade: Collection errors may occur in the data due to misunderstandings etc., unless discovered and corrected in the customs' controls. Errors may be misclassification of goods, estimation and mistaken country codes etc.

Non-response errors

Manufacturing statistics: There is response from 95 per cent of the units in the sample, so problems caused by non-response are small. The item non-response is slightly higher, i.e. that the unit has failed to respond to some but not all the questions in the survey.

Sampling errors

Manufacturing statistics: Sampling errors arise from the fact that the estimates are based on a sample and not a census of the entire population.

5.5. Comparability and coherence

Comparability over time and space

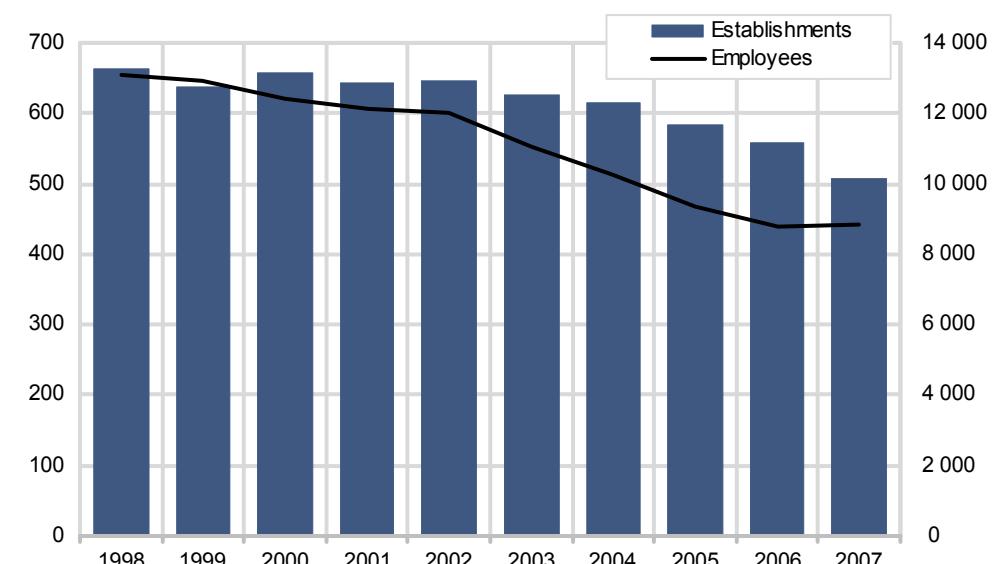

The series NOS Fishery Statistics has published time series on establishments and employment since 1972. Figures of export and import have been published since 1977.

Mainly, the data are comparable when it concerns coverage and variables. However, there have been changes in the Standard Industry Classification, sample size and minor adjustments in a few definitions. The same applies to the eight-digit, HS-based commodity classification, which is subject to revisions regularly due to development of commodities in the world trade. There are also yearly modifications at national level.

Coherence with other statistics

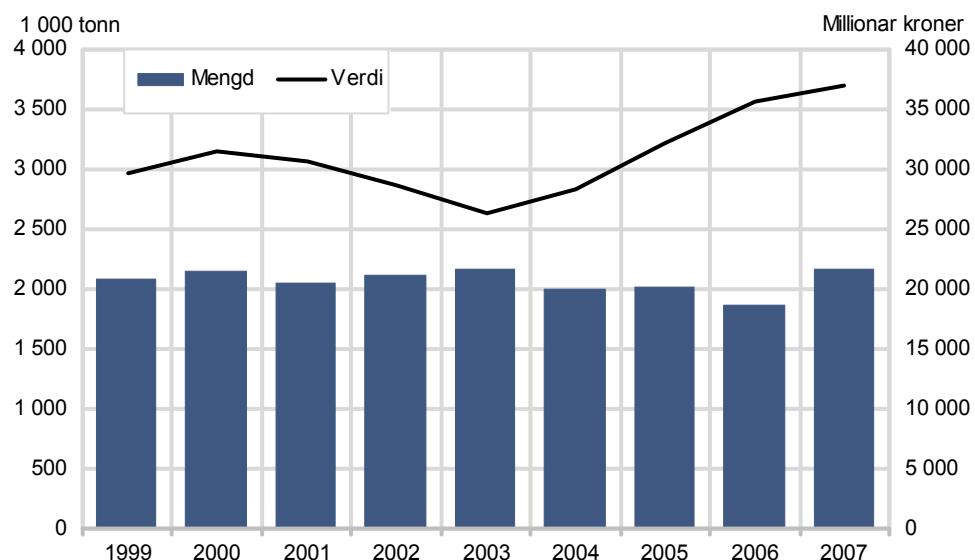

The statistics in this chapter are based on figures from the Division for Energy and Industrial Production and the Division for External Trade. More information about these statistics is available on the Internet: www.ssb.no/english/subjects/10/07/ and www.ssb.no/english/subjects/09/05/.

6. Profitability

6.1. Main results

Figures from the National Accounts show that the value added in the fisheries at basis prices was NOK 7.4 billions in 2007. This is a decrease of close to 3 per cent compared with the previous year. Operating surplus was NOK 5 166 million, down 5 per cent from 2006.

The Profitability Survey of the Directorate of Fisheries showed a top in 2006, when the average operating profit for vessels 8 metres and above reached NOK 1 013 000. In 2007, the profit results to be close to 900 000. The operating margin is still 15.5 per cent, the same as in 2006. The survey also shows that vessels registered in the county of Hordaland, and vessels 28 metres and above, in average have the biggest operating profit.

The operating margin in 2007 was the same as in the peak years 1998, 2001 and 2005 (figure 16). The development of the operating margin since 1990 has in general been positive. Main causes for this development have been large fish stocks and good prices of important species. A reduction of the fishing fleet with lower operating expenses and higher productivity is also a cause.

6.2. Statistics production

Population

The coverage of the National Accounts is defined by international guidelines of the System of National Accounts (SNA 1993), and the European System of Accounts (ESA 1995). The real accounts in current and constant prices give a structured overview of the supply and use of products (goods and services) in the economy. In addition, information on fixed assets is included, as well as wages etc. Furthermore, the real accounts provide the basis for the calculation of the Gross National Product (GNP) and other important macro economic measures.

The Profitability Survey of the Fishing Fleet covers Norwegian fishing vessels 8 metres and above operating on a whole year basis. The survey is based on the accounts from a sample of such fishing vessels. The vessels shall fulfil some conditions; to have landed catches in minimum 7 months, to have a minimum income from the catches and that the owner is work able.

Data sources, collection of data, control and revision

The calculation of the annual national accounts is based on statistics from several sources, such as the Structural Business Statistics for manufacturing and other industries, accounting statistics for general government and enterprises, statistics on wages and earnings, external trade statistics, household consumer surveys and labour statistics.

The annual national accounts for fish and fish products are mainly based on primary statistics collected by the Directorate of Fisheries.

The sources are critically evaluated and compared with alternative sources. In some areas, the statistics have to be adjusted in order to satisfy the requirements of the national accounts. In areas where the statistics are incomplete, assessments are essential. In the process of estimating national accounts data, the figures are critically evaluated and controlled in several steps.

The Profitability Survey of the Fishing Fleet is carried out by the Directorate of Fisheries. A mapping of which vessels are operating on a whole year basis is carried out in advance. The mapping is done with information from the Register of Norwegian Fishing Vessels, Register of Norwegian Fishing Licences and the Register of Landings. A sample of vessels from this mapping is asked to send in information from their accounts. Not all the owners respond to the request, while some of the information is of to poor quality to be used in the survey.

6.3. Concepts, variables and classifications

Definitions

The value added of an industry at basic prices is calculated as output at basic prices less intermediate consumption at purchasers' prices.

Operating profit is operating revenues minus operating expenses.

Operating margin is operating profit/operating revenues * 100.

Standard classifications

The accounting systems of the Norwegian National Accounts are based on the international standards for national accounts, i.e. SNA 1993 and ESA 1995. The accounting system outlines the framework and contents for the production of national accounts statistics. In addition to accounting structure, the accounting system contains a number of groupings or classifications used in the national accounts, such as:

- Activity classification
- Classification of non-financial assets
- Product classification of national accounts
- Classification of individual consumption by purpose

6.4. Sources of error and uncertainty

Measurement and processing errors

The national accounts are based on various statistical sources. The sources are either survey data from establishments, enterprises or households, or data from registers. National accounts statistics reflect the inaccuracy in the statistical sources and the methods of compilation. Weaknesses and inaccuracy in the statistical sources are normally described in the documentation of the relevant sources.

Fishermen sometimes misunderstand questions of the Profitability Survey, while errors in assessment during the revision also occur. The Directorate of Fisheries seeks to eliminate these errors and continuously improves the quality. The non-response of the survey in 2006 was 16 per cent. There is uncertainty because the statistics are based on a sample of vessels and not the whole population.

6.5. Comparability and coherence

Comparability over time and space

The series NOS Fishery Statistics has published time series on national accounts since 1972. Users of national accounts figures must be aware that changes in the statistical systems etc. may lead to minor breaks in more detailed time series. As of the 2005-edition, figures from fish farming is no longer included in table 27. This time's series is therefore not comparable with previous editions in NOS Fishery statistics.

Up to 2004 figures from The Fishing Sector Account was published in the series NOS Fishery statistics. The account was made for the Budget Commission of Fishery which was dissolved in 2004.

A figure from the Profitability Survey of the Fishing Fleet operating on a whole year basis has been published since 1977.

Coherence with other statistics

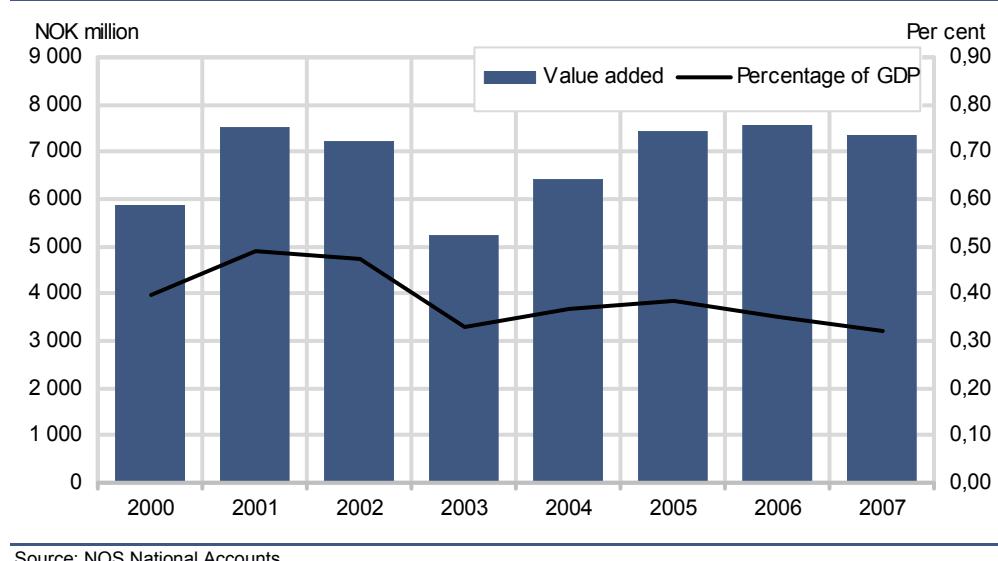

The statistics of national accounts are worked out by the Division for National Accounts. More supplementary information about these statistics can be found on the Internet: <http://www.ssb.no/english/subjects/09/01/>

More details from the profitability survey of the fishing fleet can be found on the Internet:

<http://www.fiskeridir.no/fiskeridir/statistikk/fiskeri/loennsomhetsundersoekelse-for-fiskeflaaten>

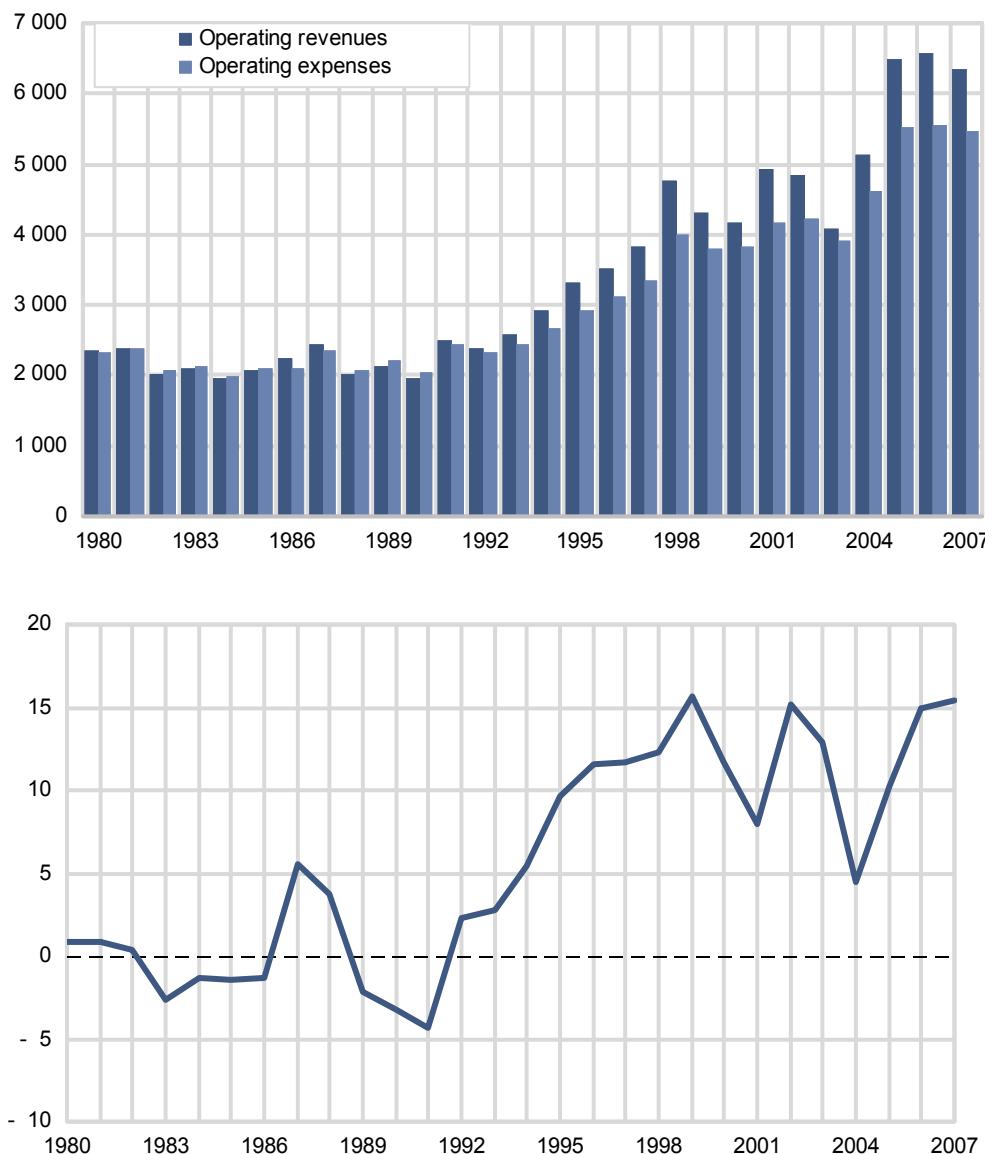

The survey was earlier published by the Budget Commission of Fishery, but as from 2004 this has been carried out by the Directorate of Fisheries. After the Budget Commission was dissolved, the Directorate has established a reference group to ensure the various users' need for data on profitability.

Commodity group	Commodity number
10. Crustaceans and molluscs, not canned	0306. 1100, 1200, 1301, 1302, 309 1401, 1409, 2100, 2200 2301, 2302, 2309, 2401, 2409 0307. 1000, 2101, 2109, 2901, 2909 3100, 3900, 4100, 4900 5100, 5900, 6000, 9101, 9102, 9109, 9900
11. Oil of herring and other fish	1504. 2021, 2031, 2099
12. Fish liver oil, excl. waste oil	1504. 1091, 1093, 1099
13. Fish, prepared or canned, incl. caviare and caviare substitutes	1604. 1101, 1102, 1109 1201, 1202, 1203, 1204, 1205, 1206, 1301, 1309, 1400, 1500, 1600 1902, 1903, 1904, 1905, 1909 2001, 2002, 2004, 2005, 2006, 2007, 2009, 3001, 3002
14. Crustaceans and molluscs, prepared or canned	1605. 1000 2003, 2004, 2005, 2009 3000, 4000, 9001, 9009
15. Meal and powder of fish, crustaceans or molluscs	0305. 1000 0306. 1900, 2900 2301. 2010, 2090
16. Other products	0301. 1000, 9100, 9200, 9300 9901, 9902, 9909 0302. 7000 0303. 8000 0304. 9001, 9009 0305. 4100, 4200, 4900 0508. 0000 0511. 9111, 9112, 9113, 9119 9191, 9192, 9193, 9199 1504. 1011, 1020, 1099 2011, 2040 3011, 3021, 3030, 3099 1516. 1020, 1603. 0010, 0020, 0092

The name of some marine animal species translated into different languages¹

Norwegian name	Zoological name	English name	French name	German name
Fisk og skaldyr	Pisces Crustacea	Fish and crustaceans	Poisson et crustacé	Fisch und Krustentier
Augepål	Trisopterus esmarkii	Norway pout	Tracaud norvégien	Stintdorsch
Blåkveite	Reinhardtius hippoglossoides	Greenland halibut	Flétan noir	Schwarzer Heilbutt
Blålange	Molva dypterygia	Blue ling	Lingue bleue	Blauleng
Breiflabb	Lophius piscatorius	Anglerfish	Baudroie	Seeteufel
Brisling	Sprattus sprattus	Sprat	Esprot	Sprott
Brosme	Brosme brosme	Tusk, cusk	Brosme	Lumb
Brugde	Cetorhinus maximus	Basking shark	Pélérin	Riesenhai
Djupvassreke	Pandalus borealis	Deep water prawn	Crevette nordique	Tiefwasser Garnele
Flekkssteinbit	Anarhichas minor	Spotted catfish	Loup tacheté	Gefleckter Katfisch
Gråsteinbit	Anarhichas lupus	Atlantic wolffish (Catfish)	Loup atlantique	Gestreifter katfisch
Havål	Conger conger	Conger eel	Congre	Meeraal
Hestmakrell	Trachurus trachurus	Horse mackerel	Chirchard	Bastardmakrele
Hummar	Homarus gammarus	European lobster	Homard	Hummer
Hyse	Melanogrammus aeglefinus	Haddock	Eglefin	Schellfish
Håbrann	Lamna nasus	Porbeagle	Taupe	Herdingshai
Håkjerring	Somniosus microcephalus	Greenland shark	Laimargue	Eishai
Kolmule	Micromesistius poutassou	Blue whiting	Poutassou	Blauer Wittling
Kongekrabbe	Paralithodes camtschaticus	King crab	Crabe royal	Königskrabbe
Krabbe (sjå Taskekrabbe)	Hippoglossus hippoglossus	Halibut	Fletan	Heilbutt
Kveite	Merlangius merlangus	Whiting	Merlan	Wittling
Laks	Salmo salar	Salmon	Saumon	Lachs
Lange	Molva molva	Ling	Lingue	Leng
Lodde	Mallotus villosus	Capelin	Capelan	Lodde
Lomre	Microstomus kitt	Lemon sole	Limande sole	Limande
Lusuer	Sebastes viviparus	Red fish	Petit sébaste -	Kleiner Rotbarsch
Lyr	Pollachius pollachius	Pollack	Lieu jaune	Pollack
Lysing	Merluccius merluccius	Hake	Merlu	Seehecht
Makrell	Scomber scombrus	Mackerel	Maquereau	Makrele
Makrellhai	Isurus oxyrinchus	Mako shark	Mako	Makrelen hai
Makrellstørje	Thunnus thynnus	Tunny, tuna	Thon	Thunfisch
Pigghå	Squalus acanthias	Picked dogfish	Aiguillat	Dornhai
Piggskate	Raja clavata	Thornback ray	Raie bouclée	Nagelrochen
Piggvar	Scophthalmus maximus	Turbot	Turbot	Steinbutt
Pir, ársmakrell	Scomber scombrus	Young mackerel	Maquereau jeune	Junge Makrele
Polartorsk	Boreogadus saida	Polar cod	Morue polaire	Polardorsch
Raudspette	Pleuronectes platessa	Plaice	Plie, carrelet	Scholle
Regnbogeaure	Oncorhynchus mykiss	Rainbow trout	Truite arc-en-ciel	Regenbogenforelle
Reke = sjå Djupvassreke	Cyclopterus lumpus	Lumpsucker	Lompe	Seehase
Rognkjeks	Sâlvælinus alpinus	Char	Omble chevalier	Seesaibling
Røye	Limanda limanda	Dab	Limande	Kliesche
Sandflyndre	Pollachius virens	Saithe	Lieu noir	Köhler, Seelachs
Sei	Clupea harengus	Herring	Hareng	Hering
Sild	Salmo trutta	Sea trout	Truite de mer	Meerforelle
Sjøaure	Nephrops norvegicus	Norway lobster	Langoustine	Kaisergranat
Sjøkreps	Rajiformes	Skates and rays	Raie	Rochen
Skater (rokker)	Gadus morhua	Spawning cod	Morue en fraie	Laichdorsch
Skrei	Scophthalmus rhombus	Brill	Barbue	Glattbutt

Norwegian name	Zoological name	English name	French name	German name
Fisk og skaldyr (framh.)				
Smørflyndre	Glyptocephalus cynoglossus	Witch	Plie grise	Rotzunge
Småsil, tobis	Ammodytes tobianus	Lesser sandeel	Lançon équille	Tobisfisch
Snabeluer	Sebastes mentella	Deep-sea redfish	Sébaste du nord	Schnabelbarsch
Steinbit	Anarhichas spp.	Catfishes	Loup de mer	Katfische
Storskate	Raja batis	Common skate	Pocheteau	Glattrochen
Straumsild	Argentina sphyraena	Lesser silver smelt	Argentine	Glasauge
Taskekrabbe	Cancer pagurus	Edible crab	Tourteau	Taschenkrebs
Tobis (sjå Småsil og havsil)				
Torsk	Gadus morhua	Cod	Morue	Kabeljau, Dorsch
Tretrådet tangbrosme	Gaidropsarus vulgaris	Three-bearded rockling	Motelle commune	Dreibärtige Seequappe
Tunge	Solea vulgaris	Sole	Sole	Seezunge
Uer	Sebastes marinus	Golden redfish	Sébaste	Rotbarsch
Vassild (Kvitlaks)	Argentina silus	Gr. silver smelt	Grande argentine	Goldlachs
Vårtorsk	Gadus morhua	Finnmark young cod	Morue du Finnmark	Finnmarkdorsch
Ål	Anguilla anguilla	Eel	Anguille	Aal
Blautdyr				
Akkar	Mollusca	Mollusc	Mollusque	Molluske
Blåskjell	Ommastrephes sagittatus	Flying squid	Calmar	Kalmar
Hjerteskjell	Mytilus edulis	Blue mussel	Moule commune	Miesmuschel
Kamskjell	Cerastoderma edule	Cockle	Coque	Herzmuschel
O-skjell	Pecten maximus	Scallop	Coquille Saint Jacques	Kammuschel
Sandskjell	Modiolus modiolus	Horse mussel	Moule appatell	Grosse Miesmuschel
Østers	Mya arenaria	Sand gaper	Mye commune	Sandmuschel
	Ostrea edulis	Common oyster	Huitre plate	Auster
Sel				
Fjordsel	Pinnipedia	Seal	Phoque	Robbe
Grønlandssel	Phoca vitulina	Common seal	Phoque commun	Seehund
Havert (gråsel)	Phoca groenlandica	Harp seal	Phoque de Groenland	Sattelrobbeicus
Kvalross	Halichoerus grypus	Grey seal	Phoque gris	Kegelrobbe
Klappmys	Odobenus rosmarus	Walrus	Morse	Walross
Ringsel	Cystophora cristata	Hooded seal	Phoque a capuchon	Klappmütze
Storkobbe	Phoca hispida	Ringed seal	Phoque annelé	Ringelrobbe
	Erignathus barbatus	Bearded seal	Phoque a barbe	Bartrobbe
Kval				
Blåkval	Cetacea	Whale	Baleine	Walfisch
Delfin	Balaenoptera musculus	Blue whale	Baleine bleue	Blauwal
Finnkval	Delphinus delphis	Common dolphin	Dauphin commun	Gemeiner Delphin
Grindkval	Balaenoptera physalus	Fin-whale	Rorqual commun	Finwal
Grønlandskval	Globicephala melaena	Pilot whale	Globicéphale	Grindwale
	Balaena mysticetus	Greenland right whale	Baleine franche	Grönlandwal
Kvitkval	Delphinapterus leucas	White whale (beluga)	Dauphin blanc (béluga)	Weisswal
Knølkval	Megaptera novaeangliae	Humpback whale	Jubarte	Buckelwal
Kvitnos	Lagenorhynchus	White beaked dolphin	Dauphin a nez	Weisschnauzenalbirostris
	dolphin	blanc	Delphin	
Kvitskjeving	Lagenorhynchus acutus	White-sided dolphin	Dauphin a flancs blanc	Weisseiten Delphin
Narkval	Monodon monoceros	Narwhal	Narval	Narwal
Nebbkval	Hyperoodon rostratus	Bottlenose	Hyperoodon	Entenwal
Nise	Phocoena phocoena	Porpoise	Marsouin	Kleiner Tümmler
Nordkaper	Eubalaena glacialis	Black right whale	Baleine de Biscaie	Nordkaper
Seikval	Balaenoptera borealis	Sei whale	Rorqual de Rudolphi	Seiwal
Spekkhoggar	Orcinus orca	Killer whale	Orque	Schwertwal
Spermkval	Physeter macrocephalus	Sperm whale	Cachalot	Pottwal
Tumler	Tursiops truncatus	Bottle-nosed dolphin	Dauphin a gros nez	Grosser Tümmler
Vågekval	Balaenoptera	Minke whale	Petit rorqual	Zwergwal
acutorostrata
